

# STM32F105xx STM32F107xx

Connectivity line, ARM-based 32-bit MCU with 64/256 KB Flash, USB OTG, Ethernet, 10 timers, 2 CANs, 2 ADCs, 14 communication interfaces

## Features

- Core: ARM 32-bit Cortex™-M3 CPU
  - 72 MHz maximum frequency, 1.25 DMIPS/MHz (Dhrystone 2.1) performance at 0 wait state memory access
  - Single-cycle multiplication and hardware division
- Memories
  - 64 to 256 Kbytes of Flash memory
  - 64 Kbytes of general-purpose SRAM
- Clock, reset and supply management
  - 2.0 to 3.6 V application supply and I/Os
  - POR, PDR, and programmable voltage detector (PVD)
  - 3-to-25 MHz crystal oscillator
  - Internal 8 MHz factory-trimmed RC
  - Internal 40 kHz RC with calibration
  - 32 kHz oscillator for RTC with calibration
- Low power
  - Sleep, Stop and Standby modes
  - V<sub>BAT</sub> supply for RTC and backup registers
- 2 × 12-bit, 1 μs A/D converters (16 channels)
  - Conversion range: 0 to 3.6 V
  - Sample and hold capability
  - Temperature sensor
  - up to 2 MSPS in interleaved mode
- 2 × 12-bit D/A converters
- DMA: 12-channel DMA controller
  - Supported peripherals: timers, ADCs, DAC, I<sup>2</sup>Ss, SPIs, I<sup>2</sup>Cs and USARTs
- Debug mode
  - Serial wire debug (SWD) & JTAG interfaces
  - Cortex-M3 Embedded Trace Macrocell™
- Up to 80 fast I/O ports
  - 51/80 I/Os, all mappable on 16 external interrupt vectors and almost all 5 V-tolerant
- CRC calculation unit, 96-bit unique ID

- Up to 10 timers with pinout remap capability
  - Up to four 16-bit timers, each with up to 4 IC/OC/PWM or pulse counter and quadrature (incremental) encoder input
  - 1 × 16-bit motor control PWM timer with dead-time generation and emergency stop
  - 2 × watchdog timers (Independent and Window)
  - SysTick timer: a 24-bit downcounter
  - 2 × 16-bit basic timers to drive the DAC
- Up to 14 communication interfaces with pinout remap capability
  - Up to 2 × I<sup>2</sup>C interfaces (SMBus/PMBus)
  - Up to 5 USARTs (ISO 7816 interface, LIN, IrDA capability, modem control)
  - Up to 3 SPIs (18 Mbit/s), 2 with a multiplexed I<sup>2</sup>S interface that offers audio class accuracy via advanced PLL schemes
  - 2 × CAN interfaces (2.0B Active) with 512 bytes of dedicated SRAM
  - USB 2.0 full-speed device/host/OTG controller with on-chip PHY that supports HNP/SRP/ID with 1.25 Kbytes of dedicated SRAM
  - 10/100 Ethernet MAC with dedicated DMA and SRAM (4 Kbytes): IEEE1588 hardware support, MII/RMII available on all packages

# 1 Introduction

This datasheet provides the description of the STM32F105xx and STM32F107xx connectivity line microcontrollers. For more details on the whole STMicroelectronics STM32F10xxx family, please refer to [Section 2.2: Full compatibility throughout the family](#).

The STM32F105xx and STM32F107xx datasheet should be read in conjunction with the STM32F10xxx reference manual.

For information on programming, erasing and protection of the internal Flash memory please refer to the STM32F10xxx Flash programming manual.

The reference and Flash programming manuals are both available from the STMicroelectronics website [www.st.com](http://www.st.com).

For information on the Cortex™-M3 core please refer to the Cortex™-M3 Technical Reference Manual, available from the [www.arm.com](http://www.arm.com) website at the following address: <http://infocenter.arm.com/help/index.jsp?topic=/com.arm.doc.ddi0337e/>.

# 2 Description

The STM32F105xx and STM32F107xx connectivity line family incorporates the high-performance ARM® Cortex™-M3 32-bit RISC core operating at a 72 MHz frequency, high-speed embedded memories (Flash memory up to 256 Kbytes and SRAM 64 Kbytes), and an extensive range of enhanced I/Os and peripherals connected to two APB buses. All devices offer two 12-bit ADCs, four general-purpose 16-bit timers plus a PWM timer, as well as standard and advanced communication interfaces: up to two I<sup>2</sup>Cs, three SPIs, two I2Ss, five USARTs, an USB OTG FS and two CANs. Ethernet is available on the STM32F107xx only.

The STM32F105xx and STM32F107xx connectivity line family operates in the –40 to +105 °C temperature range, from a 2.0 to 3.6 V power supply. A comprehensive set of power-saving mode allows the design of low-power applications.

The STM32F105xx and STM32F107xx connectivity line family offers devices in three different package types: from 64 pins to 100 pins. Depending on the device chosen, different sets of peripherals are included, the description below gives an overview of the complete range of peripherals proposed in this family.

These features make the STM32F105xx and STM32F107xx connectivity line microcontroller family suitable for a wide range of applications such as motor drives and application control, medical and handheld equipment, industrial applications, PLCs, inverters, printers, and scanners, alarm systems, video intercom, HVAC and home audio equipment.

## 2.1 Device overview

*Figure 1* shows the general block diagram of the device family.

**Table 2. STM32F105xx and STM32F107xx features and peripheral counts**

Peripherals <sup>(1)</sup>		STM32F105Rx			STM32F107Rx		STM32F105Vx			STM32F107Vx

Operating voltage		2.0 to 3.6 V									
Operating temperatures		Ambient temperatures: −40 to +85 °C /−40 to +105 °C Junction temperature: −40 to + 125 °C									

1. Please refer to [Table 5: Pin definitions](#) for peripheral availability when the I/O pins are shared by the peripherals required by the application.
2. The SPI2 and SPI3 interfaces give the flexibility to work in either the SPI mode or the I<sup>2</sup>S audio mode.

## 2.2 Full compatibility throughout the family

The STM32F105xx and STM32F107xx constitute the connectivity line family whose members are fully pin-to-pin, software and feature compatible.

The STM32F105xx and STM32F107xx are a drop-in replacement for the low-density (STM32F103x4/6), medium-density (STM32F103x8/B) and high-density (STM32F103xC/D/E) performance line devices, allowing the user to try different memory densities and peripherals providing a greater degree of freedom during the development cycle.

**Table 3. STM32F105xx and STM32F107xx family versus STM32F103xx family<sup>(1)</sup>**

STM32 device	Low-density STM32F103xx devices		Medium-density STM32F103xx devices			High-density STM32F103xx devices			STM32F105xx			STM32F107xx

1. Please refer to [Table 5: Pin definitions](#) for peripheral availability when the I/O pins are shared by the peripherals required by the application.
2. Ports F and G are not available in devices delivered in 100-pin packages.

## 2.3 Overview

Figure 1. STM32F105xx and STM32F107xx connectivity line block diagram

1.  $T_A = -40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$  (suffix 6, see [Table 62](#)) or  $-40\text{ }^{\circ}\text{C}$  to  $+105\text{ }^{\circ}\text{C}$  (suffix 7, see [Table 62](#)), junction temperature up to  $105\text{ }^{\circ}\text{C}$  or  $125\text{ }^{\circ}\text{C}$ , respectively.
2. AF = alternate function on I/O port pin.

### 2.3.1 ARM® Cortex™-M3 core with embedded Flash and SRAM

The ARM Cortex™-M3 processor is the latest generation of ARM processors for embedded systems. It has been developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced system response to interrupts.

The ARM Cortex™-M3 32-bit RISC processor features exceptional code-efficiency, delivering the high-performance expected from an ARM core in the memory size usually associated with 8- and 16-bit devices.

With its embedded ARM core, STM32F105xx and STM32F107xx connectivity line family is compatible with all ARM tools and software.

[Figure 1](#) shows the general block diagram of the device family.

### 2.3.2 Embedded Flash memory

64 to 256 Kbytes of embedded Flash is available for storing programs and data.

### 2.3.3 CRC (cyclic redundancy check) calculation unit

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from a 32-bit data word and a fixed generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

### 2.3.4 Embedded SRAM

64 Kbytes of embedded SRAM accessed (read/write) at CPU clock speed with 0 wait states.

### 2.3.5 Nested vectored interrupt controller (NVIC)

The STM32F105xx and STM32F107xx connectivity line embeds a nested vectored interrupt controller able to handle up to 67 maskable interrupt channels (not including the 16 interrupt lines of Cortex™-M3) and 16 priority levels.

- Closely coupled NVIC gives low latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Closely coupled NVIC core interface
- Allows early processing of interrupts
- Processing of *late arriving* higher priority interrupts
- Support for tail-chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

This hardware block provides flexible interrupt management features with minimal interrupt latency.

### 2.3.6 External interrupt/event controller (EXTI)

The external interrupt/event controller consists of 20 edge detector lines used to generate interrupt/event requests. Each line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The EXTI can detect an external line with a pulse width shorter than the Internal APB2 clock period. Up to 80 GPIOs can be connected to the 16 external interrupt lines.

### 2.3.7 Clocks and startup

System clock selection is performed on startup, however, the internal RC 8 MHz oscillator is selected as default CPU clock on reset. An external 3-25 MHz clock can be selected, in which case it is monitored for failure. If failure is detected, the system automatically switches back to the internal RC oscillator. A software interrupt is generated if enabled. Similarly, full interrupt management of the PLL clock entry is available when necessary (for example with failure of an indirectly used external oscillator).

A single 25 MHz crystal can clock the entire system including the ethernet and USB OTG FS peripherals. Several prescalers and PLLs allow the configuration of the AHB frequency, the high speed APB (APB2) and the low speed APB (APB1) domains. The maximum frequency of the AHB and the high speed APB domains is 72 MHz. The maximum allowed frequency of the low speed APB domain is 36 MHz. Refer to [Figure 55: USB OTG FS + Ethernet solution on page 96](#).

The advanced clock controller clocks the core and all peripherals using a single crystal or oscillator. In order to achieve audio class performance, an audio crystal can be used. In this case, the I<sup>2</sup>S master clock can generate all standard sampling frequencies from 8 kHz to 96 kHz with less than 0.5% accuracy error. Refer to [Figure 56: USB OTG FS + I2S \(Audio\) solution on page 96](#).

To configure the PLLs, please refer to [Table 63 on page 97](#), which provides PLL configurations according to the application type.

### 2.3.8 Boot modes

At startup, boot pins are used to select one of three boot options:

- Boot from User Flash
- Boot from System Memory
- Boot from embedded SRAM

The boot loader is located in System Memory. It is used to reprogram the Flash memory by using USART1, USART2 (remapped), CAN2 (remapped) or USB OTG FS in device mode (DFU: device firmware upgrade). For remapped signals refer to [Table 5: Pin definitions](#).

The USART peripheral operates with the internal 8 MHz oscillator (HSI), however the CAN and USB OTG FS can only function if an external 8 MHz, 14.7456 MHz or 25 MHz clock (HSE) is present.

For full details about the boot loader, please refer to AN2606.

### 2.3.9 Power supply schemes

- $V_{DD} = 2.0$  to  $3.6$  V: external power supply for I/Os and the internal regulator. Provided externally through  $V_{DD}$  pins.
- $V_{SSA}$ ,  $V_{DDA} = 2.0$  to  $3.6$  V: external analog power supplies for ADC, Reset blocks, RCs and PLL (minimum voltage to be applied to  $V_{DDA}$  is  $2.4$  V when the ADC is used).  $V_{DDA}$  and  $V_{SSA}$  must be connected to  $V_{DD}$  and  $V_{SS}$ , respectively.
- $V_{BAT} = 1.8$  to  $3.6$  V: power supply for RTC, external clock  $32$  kHz oscillator and backup registers (through power switch) when  $V_{DD}$  is not present.

### 2.3.10 Power supply supervisor

The device has an integrated power-on reset (POR)/power-down reset (PDR) circuitry. It is always active, and ensures proper operation starting from/down to  $2$  V. The device remains in reset mode when  $V_{DD}$  is below a specified threshold,  $V_{POR/PDR}$ , without the need for an external reset circuit.

The device features an embedded programmable voltage detector (PVD) that monitors the  $V_{DD}/V_{DDA}$  power supply and compares it to the  $V_{PVD}$  threshold. An interrupt can be generated when  $V_{DD}/V_{DDA}$  drops below the  $V_{PVD}$  threshold and/or when  $V_{DD}/V_{DDA}$  is higher than the  $V_{PVD}$  threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

### 2.3.11 Voltage regulator

The regulator has three operation modes: main (MR), low power (LPR) and power down.

- MR is used in the nominal regulation mode (Run)
- LPR is used in the Stop modes.
- Power down is used in Standby mode: the regulator output is in high impedance: the kernel circuitry is powered down, inducing zero consumption (but the contents of the registers and SRAM are lost)

This regulator is always enabled after reset. It is disabled in Standby mode.

### 2.3.12 Low-power modes

The STM32F105xx and STM32F107xx connectivity line supports three low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- **Sleep mode**  
In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.
- **Stop mode**  
Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the  $1.8$  V domain are stopped, the PLL, the HSI RC and the HSE crystal oscillators are disabled. The voltage regulator can also be put either in normal or in low-power mode.  
The device can be woken up from Stop mode by any of the EXTI line. The EXTI line source can be one of the  $16$  external lines, the PVD output, the RTC alarm or the USB OTG FS wakeup.

- **Standby mode**

The Standby mode is used to achieve the lowest power consumption. The internal voltage regulator is switched off so that the entire 1.8 V domain is powered off. The PLL, the HSI RC and the HSE crystal oscillators are also switched off. After entering Standby mode, SRAM and register contents are lost except for registers in the Backup domain and Standby circuitry.

The device exits Standby mode when an external reset (NRST pin), an IWDG reset, a rising edge on the WKUP pin, or an RTC alarm occurs.

*Note: The RTC, the IWDG, and the corresponding clock sources are not stopped by entering Stop or Standby mode.*

### 2.3.13 DMA

The flexible 12-channel general-purpose DMAs (7 channels for DMA1 and 5 channels for DMA2) are able to manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. The two DMA controllers support circular buffer management, removing the need for user code intervention when the controller reaches the end of the buffer.

Each channel is connected to dedicated hardware DMA requests, with support for software trigger on each channel. Configuration is made by software and transfer sizes between source and destination are independent.

The DMA can be used with the main peripherals: SPI, I<sup>2</sup>C, USART, general-purpose, basic and advanced control timers TIMx, DAC, I<sup>2</sup>S and ADC.

In the STM32F107xx, there is a DMA controller dedicated for use with the Ethernet (see [Section 2.3.20: Ethernet MAC interface with dedicated DMA and IEEE 1588 support](#) for more information).

### 2.3.14 RTC (real-time clock) and backup registers

The RTC and the backup registers are supplied through a switch that takes power either on V<sub>DD</sub> supply when present or through the V<sub>BAT</sub> pin. The backup registers are forty-two 16-bit registers used to store 84 bytes of user application data when V<sub>DD</sub> power is not present. They are not reset by a system or power reset, and they are not reset when the device wakes up from the Standby mode.

The real-time clock provides a set of continuously running counters which can be used with suitable software to provide a clock calendar function, and provides an alarm interrupt and a periodic interrupt. It is clocked by a 32.768 kHz external crystal, resonator or oscillator, the internal low power RC oscillator or the high-speed external clock divided by 128. The internal low-speed RC has a typical frequency of 40 kHz. The RTC can be calibrated using an external 512 Hz output to compensate for any natural quartz deviation. The RTC features a 32-bit programmable counter for long term measurement using the Compare register to generate an alarm. A 20-bit prescaler is used for the time base clock and is by default configured to generate a time base of 1 second from a clock at 32.768 kHz.

For more information, please refer to AN2604: “STM32F101xx and STM32F103xx RTC calibration”, available from [www.st.com](http://www.st.com).

## 2.3.15 Timers and watchdogs

The STM32F105xx and STM32F107xx devices include an advanced-control timer, four general-purpose timers, two basic timers, two watchdog timers and a SysTick timer.

[Table 4](#) compares the features of the general-purpose and basic timers.

**Table 4. Timer feature comparison**

Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/compare channels	Complementary outputs
TIM1	16-bit	Up, down, up/down	Any integer between 1 and 65536	Yes	4	Yes
TIMx (TIM2, TIM3, TIM4, TIM5)	16-bit	Up, down, up/down	Any integer between 1 and 65536	Yes	4	No
TIM6, TIM7	16-bit	Up	Any integer between 1 and 65536	Yes	0	No

### Advanced-control timer (TIM1)

The advanced control timer (TIM1) can be seen as a three-phase PWM multiplexed on 6 channels. It has complementary PWM outputs with programmable inserted dead-times. It can also be seen as a complete general-purpose timer. The 4 independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned modes)
- One-pulse mode output

If configured as a standard 16-bit timer, it has the same features as the TIMx timer. If configured as the 16-bit PWM generator, it has full modulation capability (0-100%).

The counter can be frozen in debug mode.

Many features are shared with those of the standard TIM timers which have the same architecture. The advanced control timer can therefore work together with the TIM timers via the Timer Link feature for synchronization or event chaining.

### General-purpose timers (TIMx)

There are up to 4 synchronizable standard timers (TIM2, TIM3, TIM4 and TIM5) embedded in the STM32F105xx and STM32F107xx connectivity line devices. These timers are based on a 16-bit auto-reload up/down counter, a 16-bit prescaler and feature 4 independent channels each for input capture/output compare, PWM or one pulse mode output. This gives up to 16 input captures / output compares / PWMs on the largest packages. They can work together with the Advanced Control timer via the Timer Link feature for synchronization or event chaining.

The counter can be frozen in debug mode.

Any of the standard timers can be used to generate PWM outputs. Each of the timers has independent DMA request generations.

### Basic timers TIM6 and TIM7

These timers are mainly used for DAC trigger generation. They can also be used as a generic 16-bit time base.

### Independent watchdog

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 40 kHz internal RC and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

### Window watchdog

The window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

### SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

- A 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0.
- Programmable clock source

## 2.3.16 I<sup>2</sup>C bus

Up to two I<sup>2</sup>C bus interfaces can operate in multimaster and slave modes. They can support standard and fast modes.

They support 7/10-bit addressing mode and 7-bit dual addressing mode (as slave). A hardware CRC generation/verification is embedded.

They can be served by DMA and they support SMBus 2.0/PMBus.

## 2.3.17 Universal synchronous/asynchronous receiver transmitters (USARTs)

The STM32F105xx and STM32F107xx connectivity line embeds three universal synchronous/asynchronous receiver transmitters (USART1, USART2 and USART3) and two universal asynchronous receiver transmitters (UART4 and UART5).

These five interfaces provide asynchronous communication, IrDA SIR ENDEC support, multiprocessor communication mode, single-wire half-duplex communication mode and have LIN Master/Slave capability.

The USART1 interface is able to communicate at speeds of up to 4.5 Mbit/s. The other available interfaces communicate at up to 2.25 Mbit/s.

USART1, USART2 and USART3 also provide hardware management of the CTS and RTS signals, Smart Card mode (ISO 7816 compliant) and SPI-like communication capability. All interfaces can be served by the DMA controller except for UART5.

### 2.3.18 Serial peripheral interface (SPI)

Up to three SPIs are able to communicate up to 18 Mbits/s in slave and master modes in full-duplex and simplex communication modes. The 3-bit prescaler gives 8 master mode frequencies and the frame is configurable to 8 bits or 16 bits. The hardware CRC generation/verification supports basic SD Card/MMC/SDHC<sup>(a)</sup> modes.

All SPIs can be served by the DMA controller.

### 2.3.19 Inter-integrated sound (I<sup>2</sup>S)

Two standard I<sup>2</sup>S interfaces (multiplexed with SPI2 and SPI3) are available, that can be operated in master or slave mode. These interfaces can be configured to operate with 16/32 bit resolution, as input or output channels. Audio sampling frequencies from 8 kHz up to 96 kHz are supported. When either or both of the I<sup>2</sup>S interfaces is/are configured in master mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency with less than 0.5% accuracy error owing to the advanced clock controller (see [Section 2.3.7: Clocks and startup](#)).

Please refer to the “Audio frequency precision” tables provided in the “Serial peripheral interface (SPI)” section of the STM32F10xxx reference manual.

### 2.3.20 Ethernet MAC interface with dedicated DMA and IEEE 1588 support

Peripheral not available on STM32F105xx devices.

The STM32F107xx devices provide an IEEE-802.3-2002-compliant media access controller (MAC) for ethernet LAN communications through an industry-standard media-independent interface (MII) or a reduced media-independent interface (RMII). The STM32F107xx requires an external physical interface device (PHY) to connect to the physical LAN bus (twisted-pair, fiber, etc.). the PHY is connected to the STM32F107xx MII port using as many as 17 signals (MII) or 9 signals (RMII) and can be clocked using the 25 MHz (MII) or 50 MHz (RMII) output from the STM32F107xx.

The STM32F107xx includes the following features:

- Supports 10 and 100 Mbit/s rates
- Dedicated DMA controller allowing high-speed transfers between the dedicated SRAM and the descriptors (see the STM32F105xx/STM32F107xx reference manual for details)
- Tagged MAC frame support (VLAN support)
- Half-duplex (CSMA/CD) and full-duplex operation
- MAC control sublayer (control frames) support

---

a. SDHC = Secure digital high capacity.

- 32-bit CRC generation and removal
- Several address filtering modes for physical and multicast address (multicast and group addresses)
- 32-bit status code for each transmitted or received frame
- Internal FIFOs to buffer transmit and receive frames. The transmit FIFO and the receive FIFO are both 2 Kbytes, that is 4 Kbytes in total
- Supports hardware PTP (precision time protocol) in accordance with IEEE 1588 with the timestamp comparator connected to the TIM2 trigger input
- Triggers interrupt when system time becomes greater than target time

### 2.3.21 Controller area network (CAN)

The two CANs are compliant with the 2.0A and B (active) specifications with a bitrate up to 1 Mbit/s. They can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. Each CAN has three transmit mailboxes, two receive FIFOs with 3 stages and 28 shared scalable filter banks (all of them can be used even if one CAN is used). The 256 bytes of SRAM which are allocated for each CAN (512 bytes in total) are not shared with any other peripheral.

### 2.3.22 Universal serial bus on-the-go full-speed (USB OTG FS)

The STM32F105xx and STM32F107xx connectivity line devices embed a USB OTG full-speed (12 Mb/s) device/host/OTG peripheral with integrated transceivers. The USB OTG FS peripheral is compliant with the USB 2.0 specification and with the OTG 1.0 specification. It has software-configurable endpoint setting and supports suspend/resume. The USB OTG full-speed controller requires a dedicated 48 MHz clock that is generated by a PLL connected to the HSE oscillator. The major features are:

- 1.25 KB of SRAM used exclusively by the endpoints (not shared with any other peripheral)
- 4 bidirectional endpoints
- HNP/SNP/IP inside (no need for any external resistor)
- for OTG/Host modes, a power switch is needed in case bus-powered devices are connected
- the SOF output can be used to synchronize the external audio DAC clock in isochronous mode
- in accordance with the USB 2.0 Specification, the supported transfer speeds are:
  - in Host mode: full speed and low speed
  - in Device mode: full speed

### 2.3.23 GPIOs (general-purpose inputs/outputs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high current-capable.

The I/Os alternate function configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

I/Os on APB2 with up to 18 MHz toggling speed

### 2.3.24 Remap capability

This feature allows the use of a maximum number of peripherals in a given application. Indeed, alternate functions are available not only on the default pins but also on other specific pins onto which they are remappable. This has the advantage of making board design and port usage much more flexible.

For details refer to [Table 5: Pin definitions](#); it shows the list of remappable alternate functions and the pins onto which they can be remapped. See the STM32F10xxx reference manual for software considerations.

### 2.3.25 ADCs (analog-to-digital converters)

Two 12-bit analog-to-digital converters are embedded into STM32F105xx and STM32F107xx connectivity line devices and each ADC shares up to 16 external channels, performing conversions in single-shot or scan modes. In scan mode, automatic conversion is performed on a selected group of analog inputs.

Additional logic functions embedded in the ADC interface allow:

- Simultaneous sample and hold
- Interleaved sample and hold
- Single shunt

The ADC can be served by the DMA controller.

An analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

The events generated by the standard timers (TIMx) and the advanced-control timer (TIM1) can be internally connected to the ADC start trigger and injection trigger, respectively, to allow the application to synchronize A/D conversion and timers.

### 2.3.26 DAC (digital-to-analog converter)

The two 12-bit buffered DAC channels can be used to convert two digital signals into two analog voltage signal outputs. The chosen design structure is composed of integrated resistor strings and an amplifier in inverting configuration.

This dual digital Interface supports the following features:

- two DAC converters: one for each output channel
- 8-bit or 12-bit monotonic output
- left or right data alignment in 12-bit mode
- synchronized update capability
- noise-wave generation
- triangular-wave generation
- dual DAC channel independent or simultaneous conversions
- DMA capability for each channel
- external triggers for conversion
- input voltage reference  $V_{REF+}$

Eight DAC trigger inputs are used in the STM32F105xx and STM32F107xx connectivity line family. The DAC channels are triggered through the timer update outputs that are also connected to different DMA channels.

### 2.3.27 Temperature sensor

The temperature sensor has to generate a voltage that varies linearly with temperature. The conversion range is between  $2\text{ V} < V_{\text{DDA}} < 3.6\text{ V}$ . The temperature sensor is internally connected to the ADC1\_IN16 input channel which is used to convert the sensor output voltage into a digital value.

### 2.3.28 Serial wire JTAG debug port (SWJ-DP)

The ARM SWJ-DP Interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target. The JTAG TMS and TCK pins are shared respectively with SWDIO and SWCLK and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

### 2.3.29 Embedded Trace Macrocell™

The ARM® Embedded Trace Macrocell provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the STM32F10xxx through a small number of ETM pins to an external hardware trace port analyzer (TPA) device. The TPA is connected to a host computer using USB, Ethernet, or any other high-speed channel. Real-time instruction and data flow activity can be recorded and then formatted for display on the host computer running debugger software. TPA hardware is commercially available from common development tool vendors. It operates with third party debugger software tools.

C4	-	98	PE1	I/O	FT	PE1		
E5	63	99	V <sub>SS_3</sub>	S		V <sub>SS_3</sub>		
F5	64	100	V <sub>DD_3</sub>	S		V <sub>DD_3</sub>		

1. I = input, O = output, S = supply, HiZ = high impedance.
2. FT = 5 V tolerant. All I/Os are V<sub>DD</sub> capable.
3. Function availability depends on the chosen device.
4. If several peripherals share the same I/O pin, to avoid conflict between these alternate functions only one peripheral should be enabled at a time through the peripheral clock enable bit (in the corresponding RCC peripheral clock enable register).
5. PC13, PC14 and PC15 are supplied through the power switch, and so their use in output mode is limited: they can be used only in output 2 MHz mode with a maximum load of 30 pF and only one pin can be put in output mode at a time.
6. Main function after the first backup domain power-up. Later on, it depends on the contents of the Backup registers even after reset (because these registers are not reset by the main reset). For details on how to manage these I/Os, refer to the Battery backup domain and BKP register description sections in the STM32F10xxx reference manual, available from the STMicroelectronics website: [www.st.com](http://www.st.com).
7. This alternate function can be remapped by software to some other port pins (if available on the used package). For more details, refer to the Alternate function I/O and debug configuration section in the STM32F10xxx reference manual, available from the STMicroelectronics website: [www.st.com](http://www.st.com).
8. SPI2/I2S2 and I2C2 are not available when the Ethernet is being used.
9. For the LQFP64 package, the pins number 5 and 6 are configured as OSC\_IN/OSC\_OUT after reset, however the functionality of PD0 and PD1 can be remapped by software on these pins. For the LQFP100 and BGA100 packages, PD0 and PD1 are available by default, so there is no need for remapping. For more details, refer to Alternate function I/O and debug configuration section in the STM32F10xxx reference manual.

## 4 Memory mapping

The memory map is shown in [Figure 5](#).

**Figure 5. Memory map**

## 5 Electrical characteristics

### 5.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to  $V_{SS}$ .

#### 5.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = 25\text{ }^{\circ}\text{C}$  and  $T_A = T_{A\text{max}}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ( $\text{mean} \pm 3\Sigma$ ).

#### 5.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ }^{\circ}\text{C}$ ,  $V_{DD} = 3.3\text{ V}$  (for the  $2\text{ V} \leq V_{DD} \leq 3.6\text{ V}$  voltage range). They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated ( $\text{mean} \pm 2\Sigma$ ).

#### 5.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 5.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 6](#).

#### 5.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 7](#).

**Figure 6. Pin loading conditions**

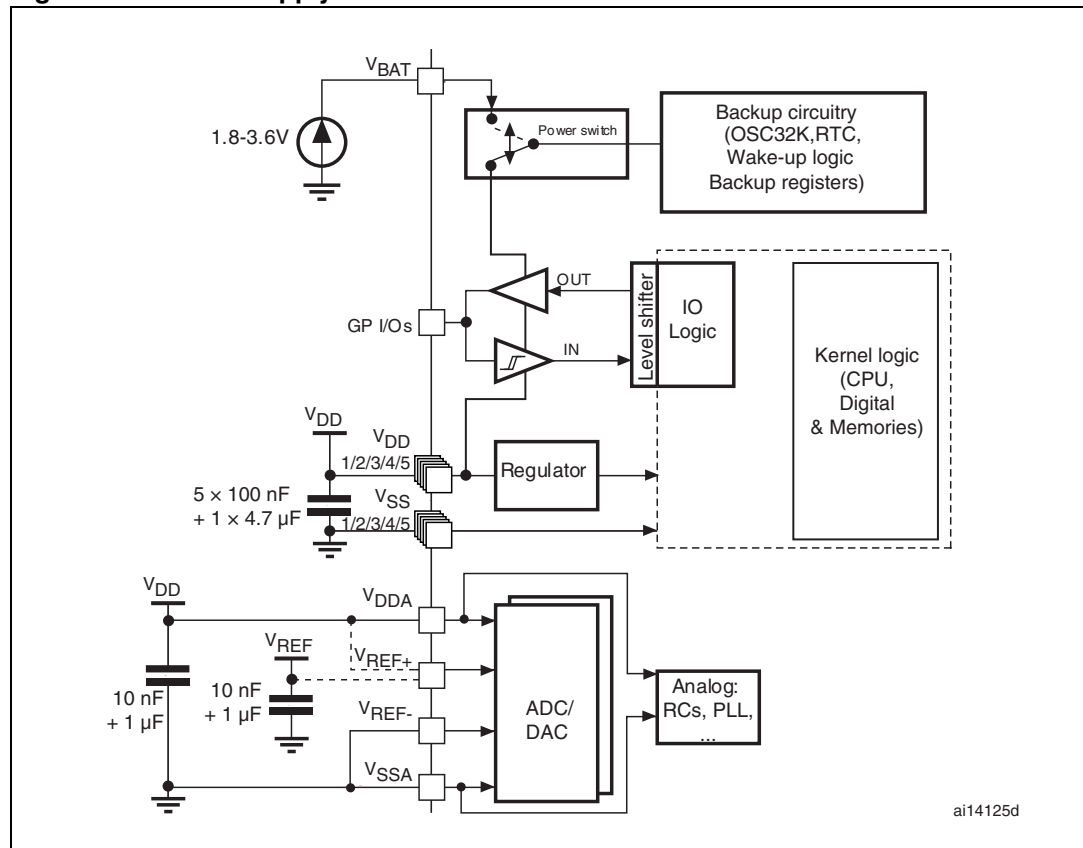

**Figure 7. Pin input voltage**

### 5.1.6 Power supply scheme

Figure 8. Power supply scheme

**Caution:** In [Figure 8](#), the 4.7  $\mu\text{F}$  capacitor must be connected to  $V_{DD3}$ .

### 5.1.7 Current consumption measurement

Figure 9. Current consumption measurement scheme

## 5.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 6: Voltage characteristics](#), [Table 7: Current characteristics](#), and [Table 8: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 6. Voltage characteristics**

Symbol	Ratings	Min	Max	Unit
$V_{DD}-V_{SS}$	External main supply voltage (including $V_{DDA}$ and $V_{DD}$ ) <sup>(1)</sup>	-0.3	4.0	V
$V_{IN}$ <sup>(2)</sup>	Input voltage on five volt tolerant pin	$V_{SS} - 0.3$	$V_{DD} + 4.0$	
	Input voltage on any other pin	$V_{SS} - 0.3$	4.0	
$ \Delta V_{DDx} $	Variations between different $V_{DD}$ power pins		50	mV
$ V_{SSx} - V_{SS} $	Variations between all the different ground pins		50	
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	see <a href="#">Section 5.3.11: Absolute maximum ratings (electrical sensitivity)</a>		

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2.  $V_{IN}$  maximum must always be respected. Refer to [Table 7: Current characteristics](#) for the maximum allowed injected current values.

**Table 7. Current characteristics**

Symbol	Ratings	Max.	Unit
$I_{VDD}$	Total current into $V_{DD}/V_{DDA}$ power lines (source) <sup>(1)</sup>	150	mA
$I_{VSS}$	Total current out of $V_{SS}$ ground lines (sink) <sup>(1)</sup>	150	
$I_{IO}$	Output current sunk by any I/O and control pin	25	
	Output current source by any I/Os and control pin	- 25	
$I_{INJ(PIN)}$ <sup>(2)</sup>	Injected current on five volt tolerant pins <sup>(3)</sup>	-5/+0	
	Injected current on any other pin <sup>(4)</sup>	± 5	
$\Sigma I_{INJ(PIN)}$	Total injected current (sum of all I/O and control pins) <sup>(5)</sup>	± 25	

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2. Negative injection disturbs the analog performance of the device. See [Note: on page 75](#).
3. Positive injection is not possible on these I/Os. A negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 6: Voltage characteristics](#) for the maximum allowed input voltage values.
4. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 6: Voltage characteristics](#) for the maximum allowed input voltage values.
5. When several inputs are submitted to a current injection, the maximum  $\Sigma I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values).

**Table 8. Thermal characteristics**

Symbol	Ratings	Value	Unit
$T_{STG}$	Storage temperature range	–65 to +150	°C
$T_J$	Maximum junction temperature	150	°C

## 5.3 Operating conditions

### 5.3.1 General operating conditions

**Table 9. General operating conditions**

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{HCLK}$	Internal AHB clock frequency		0	72	MHz
$f_{PCLK1}$	Internal APB1 clock frequency		0	36	
$f_{PCLK2}$	Internal APB2 clock frequency		0	72	
$V_{DD}$	Standard operating voltage		2	3.6	V
$V_{DDA}^{(1)}$	Analog operating voltage (ADC not used)	Must be the same potential as $V_{DD}^{(2)}$	2	3.6	V
	Analog operating voltage (ADC used)		2.4	3.6	
$V_{BAT}$	Backup operating voltage		1.8	3.6	V
$P_D$	Power dissipation at $T_A = 85\text{ °C}$ for suffix 6 or $T_A = 105\text{ °C}$ for suffix 7 <sup>(3)</sup>	LFBGA100		500	mW
		LQFP100		434	
		LQFP64		444	
$P_D$	Power dissipation at $T_A = 85\text{ °C}$ for suffix 6 or $T_A = 105\text{ °C}$ for suffix 7 <sup>(4)</sup>	LQFP100		434	mW
		LQFP64		444	
$T_A$	Ambient temperature for 6 suffix version	Maximum power dissipation	–40	85	°C
		Low power dissipation <sup>(5)</sup>	–40	105	
	Ambient temperature for 7 suffix version	Maximum power dissipation	–40	105	°C
		Low power dissipation <sup>(5)</sup>	–40	125	
$T_J$	Junction temperature range	6 suffix version	–40	105	°C
		7 suffix version	–40	125	

1. When the ADC is used, refer to [Table 52: ADC characteristics](#).
2. It is recommended to power  $V_{DD}$  and  $V_{DDA}$  from the same source. A maximum difference of 300 mV between  $V_{DD}$  and  $V_{DDA}$  can be tolerated during power-up and operation.
3. If  $T_A$  is lower, higher  $P_D$  values are allowed as long as  $T_J$  does not exceed  $T_{Jmax}$ .
4. If  $T_A$  is lower, higher  $P_D$  values are allowed as long as  $T_J$  does not exceed  $T_{Jmax}$ .
5. In low power dissipation state,  $T_A$  can be extended to this range as long as  $T_J$  does not exceed  $T_{Jmax}$ .

### 5.3.2 Operating conditions at power-up / power-down

Subject to general operating conditions for  $T_A$ .

**Table 10. Operating conditions at power-up / power-down**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{VDD}$	$V_{DD}$ rise time rate		0	$\infty$	$\mu\text{s/V}$
	$V_{DD}$ fall time rate		20	$\infty$	

### 5.3.3 Embedded reset and power control block characteristics

The parameters given in [Table 11](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 11. Embedded reset and power control block characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{PVD}$	Programmable voltage detector level selection	PLS[2:0]=000 (rising edge)	2.1	2.18	2.26	V
		PLS[2:0]=000 (falling edge)	2	2.08	2.16	V
		PLS[2:0]=001 (rising edge)	2.19	2.28	2.37	V
		PLS[2:0]=001 (falling edge)	2.09	2.18	2.27	V
		PLS[2:0]=010 (rising edge)	2.28	2.38	2.48	V
		PLS[2:0]=010 (falling edge)	2.18	2.28	2.38	V
		PLS[2:0]=011 (rising edge)	2.38	2.48	2.58	V
		PLS[2:0]=011 (falling edge)	2.28	2.38	2.48	V
		PLS[2:0]=100 (rising edge)	2.47	2.58	2.69	V
		PLS[2:0]=100 (falling edge)	2.37	2.48	2.59	V
		PLS[2:0]=101 (rising edge)	2.57	2.68	2.79	V
		PLS[2:0]=101 (falling edge)	2.47	2.58	2.69	V
		PLS[2:0]=110 (rising edge)	2.66	2.78	2.9	V
		PLS[2:0]=110 (falling edge)	2.56	2.68	2.8	V
		PLS[2:0]=111 (rising edge)	2.76	2.88	3	V
		PLS[2:0]=111 (falling edge)	2.66	2.78	2.9	V
$V_{PVDhyst}^{(2)}$	PVD hysteresis			100		mV
$V_{POR/PDR}$	Power on/power down reset threshold	Falling edge	1.8 <sup>(1)</sup>	1.88	1.96	V
		Rising edge	1.84	1.92	2.0	V
$V_{PDRhyst}^{(2)}$	PDR hysteresis			40		mV
$T_{RSTTEMPO}^{(2)}$	Reset temporization		1	2.5	4.5	ms

1. The product behavior is guaranteed by design down to the minimum  $V_{POR/PDR}$  value.

2. Guaranteed by design, not tested in production.

### 5.3.4 Embedded reference voltage

The parameters given in [Table 12](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 12. Embedded internal reference voltage**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{REFINT}$	Internal reference voltage	$-40\text{ }^{\circ}\text{C} < T_A < +105\text{ }^{\circ}\text{C}$	1.16	1.20	1.26	V
		$-40\text{ }^{\circ}\text{C} < T_A < +85\text{ }^{\circ}\text{C}$	1.16	1.20	1.24	V
$T_{S\_vrefint}^{(1)}$	ADC sampling time when reading the internal reference voltage			5.1	17.1 <sup>(2)</sup>	$\mu\text{s}$
$V_{RERINT}^{(2)}$	Internal reference voltage spread over the temperature range	$V_{DD} = 3\text{ V} \pm 10\text{ mV}$			10	mV
$T_{Coeff}^{(2)}$	Temperature coefficient				100	ppm/ $^{\circ}\text{C}$

1. Shortest sampling time can be determined in the application by multiple iterations.

2. Guaranteed by design, not tested in production.

### 5.3.5 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in [Figure 9: Current consumption measurement scheme](#).

All Run-mode current consumption measurements given in this section are performed with a reduced code that gives a consumption equivalent to Dhrystone 2.1 code.

#### Maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in input mode with a static value at  $V_{DD}$  or  $V_{SS}$  (no load)
- All peripherals are disabled except when explicitly mentioned
- The Flash memory access time is adjusted to the  $f_{HCLK}$  frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states above)
- Prefetch in ON (reminder: this bit must be set before clock setting and bus prescaling)
- When the peripherals are enabled  $f_{PCLK1} = f_{HCLK}/2$ ,  $f_{PCLK2} = f_{HCLK}$

The parameters given in [Table 13](#), [Table 14](#) and [Table 15](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 13. Maximum current consumption in Run mode, code with data processing running from Flash**

Symbol	Parameter	Conditions	$f_{HCLK}$	Max <sup>(1)</sup>		Unit
				$T_A = 85\text{ °C}$	$T_A = 105\text{ °C}$	
$I_{DD}$	Supply current in Run mode	External clock <sup>(2)</sup> , all peripherals enabled	72 MHz	68	68.4	mA
			48 MHz	49	49.2	
			36 MHz	38.7	38.9	
			24 MHz	27.3	27.9	
			16 MHz	20.2	20.5	
			8 MHz	10.2	10.8	
		External clock <sup>(3)</sup> , all peripherals disabled	72 MHz	32.7	32.9	
			48 MHz	25	25.2	
			36 MHz	20.3	20.6	
			24 MHz	14.8	15.1	
			16 MHz	11.2	11.7	
			8 MHz	6.6	7.2	

1. Based on characterization, not tested in production.

2. External clock is 8 MHz and PLL is on when  $f_{HCLK} > 8\text{ MHz}$ .

**Table 14. Maximum current consumption in Run mode, code with data processing running from RAM**

Symbol	Parameter	Conditions	$f_{HCLK}$	Max <sup>(1)</sup>		Unit
				$T_A = 85\text{ °C}$	$T_A = 105\text{ °C}$	
$I_{DD}$	Supply current in Run mode	External clock <sup>(2)</sup> , all peripherals enabled	72 MHz	65.5	66	mA
			48 MHz	45.4	46	
			36 MHz	35.5	36.1	
			24 MHz	25.2	25.6	
			16 MHz	18	18.5	
			8 MHz	10.5	11	
		External clock <sup>(3)</sup> , all peripherals disabled	72 MHz	31.4	31.9	
			48 MHz	27.8	28.2	
			36 MHz	17.6	18.3	
			24 MHz	13.1	13.8	
			16 MHz	10.2	10.9	
			8 MHz	6.1	7.8	

1. Based on characterization, tested in production at  $V_{DD}$  max,  $f_{HCLK}$  max..

2. External clock is 8 MHz and PLL is on when  $f_{HCLK} > 8\text{ MHz}$ .

**Table 15. Maximum current consumption in Sleep mode, code running from Flash or RAM**

Symbol	Parameter	Conditions	$f_{HCLK}$	Max <sup>(1)</sup>		Unit
				$T_A = 85\text{ °C}$	$T_A = 105\text{ °C}$	
$I_{DD}$	Supply current in Sleep mode	External clock <sup>(2)</sup> , all peripherals enabled	72 MHz	48.4	49	mA
			48 MHz	33.9	34.4	
			36 MHz	26.7	27.2	
			24 MHz	19.3	19.8	
			16 MHz	14.2	14.8	
			8 MHz	8.7	9.1	
		External clock <sup>(3)</sup> , all peripherals disabled	72 MHz	10.1	10.6	
			48 MHz	8.3	8.75	
			36 MHz	7.5	8	
			24 MHz	6.6	7.1	
			16 MHz	6	6.5	
			8 MHz	2.5	3	

1. Based on characterization, tested in production at  $V_{DD}$  max and  $f_{HCLK}$  max with peripherals enabled.

2. External clock is 8 MHz and PLL is on when  $f_{HCLK} > 8$  MHz.

**Table 16. Typical and maximum current consumptions in Stop and Standby modes**

Symbol	Parameter	Conditions	Typ <sup>(1)</sup>			Max		Unit
			$V_{DD}/V_{BAT} = 2.0\text{ V}$	$V_{DD}/V_{BAT} = 2.4\text{ V}$	$V_{DD}/V_{BAT} = 3.3\text{ V}$	$T_A = 85\text{ °C}$	$T_A = 105\text{ °C}$	
$I_{DD}$	Supply current in Stop mode	Regulator in Run mode, low-speed and high-speed internal RC oscillators and high-speed oscillator OFF (no independent watchdog)		32	33	600	1300	$\mu\text{A}$
		Regulator in Low Power mode, low-speed and high-speed internal RC oscillators and high-speed oscillator OFF (no independent watchdog)		25	26	590	1280	
	Supply current in Standby mode	Low-speed internal RC oscillator and independent watchdog ON		3	3.8	-	-	
		Low-speed internal RC oscillator ON, independent watchdog OFF		2.8	3.6	-	-	
		Low-speed internal RC oscillator and independent watchdog OFF, low-speed oscillator and RTC OFF		1.9	2.1	5 <sup>(2)</sup>	6.5 <sup>(2)</sup>	
$I_{DD\_VBAT}$	Backup domain supply current	Low-speed oscillator and RTC ON	1.1	1.2	1.4	2.1 <sup>(2)</sup>	2.3 <sup>(2)</sup>	

1. Typical values are measured at  $T_A = 25\text{ °C}$ .

2. Based on characterization, not tested in production.

Figure 10. Typical current consumption on  $V_{BAT}$  with RTC on vs. temperature at different  $V_{BAT}$  values

Figure 11. Typical current consumption in Stop mode with regulator in Run mode versus temperature at different  $V_{DD}$  values

**Figure 12. Typical current consumption in Stop mode with regulator in Low-power mode versus temperature at different  $V_{DD}$  values**

**Figure 13. Typical current consumption in Standby mode versus temperature at different  $V_{DD}$  values**

### Typical current consumption

The MCU is placed under the following conditions:

- All I/O pins are in input mode with a static value at  $V_{DD}$  or  $V_{SS}$  (no load).
- All peripherals are disabled except if it is explicitly mentioned.
- The Flash access time is adjusted to  $f_{HCLK}$  frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states above).
- Ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).
- Prefetch is ON (Reminder: this bit must be set before clock setting and bus prescaling)

When the peripherals are enabled  $f_{PCLK1} = f_{HCLK}/4$ ,  $f_{PCLK2} = f_{HCLK}/2$ ,  $f_{ADCCLK} = f_{PCLK2}/4$

**Table 17. Typical current consumption in Run mode, code with data processing running from Flash**

Symbol	Parameter	Conditions	f <sub>HCLK</sub>	Typ <sup>(1)</sup>		Unit
				All peripherals enabled <sup>(2)</sup>	All peripherals disabled	
I <sub>DD</sub>	Supply current in Run mode	External clock <sup>(3)</sup>	72 MHz	47.3	28.3	mA
			48 MHz	32	19.6	
			36 MHz	24.6	15.4	
			24 MHz	16.8	10.6	
			16 MHz	11.8	7.4	
			8 MHz	5.9	3.7	
			4 MHz	3.7	2.9	
			2 MHz	2.5	2	
			1 MHz	1.8	1.53	
			500 kHz	1.5	1.3	
			125 kHz	1.3	1.2	
		Running on high speed internal RC (HSI), AHB prescaler used to reduce the frequency	36 MHz	23.9	14.8	mA
			24 MHz	16.1	9.7	
			16 MHz	11.1	6.7	
			8 MHz	5.6	3.8	
			4 MHz	3.1	2.1	
			2 MHz	1.8	1.3	
			1 MHz	1.16	0.9	
			500 kHz	0.8	0.67	
			125 kHz	0.6	0.5	

1. Typical values are measures at T<sub>A</sub> = 25 °C, V<sub>DD</sub> = 3.3 V.

2. Add an additional power consumption of 0.8 mA per ADC for the analog part. In applications, this consumption occurs only while the ADC is on (ADON bit is set in the ADC\_CR2 register).

3. External clock is 8 MHz and PLL is on when f<sub>HCLK</sub> > 8 MHz.

**Table 18. Typical current consumption in Sleep mode, code running from Flash or RAM**

Symbol	Parameter	Conditions	f <sub>HCLK</sub>	Typ <sup>(1)</sup>		Unit
				All peripherals enabled <sup>(2)</sup>	All peripherals disabled	
I <sub>DD</sub>	Supply current in Sleep mode	External clock <sup>(3)</sup>	72 MHz	28.2	6	mA
			48 MHz	19	4.2	
			36 MHz	14.7	3.4	
			24 MHz	10.1	2.5	
			16 MHz	6.7	2	
			8 MHz	3.2	1.3	
			4 MHz	2.3	1.2	
			2 MHz	1.7	1.16	
			1 MHz	1.5	1.1	
			500 kHz	1.3	1.05	
			125 kHz	1.2	1.05	
		Running on high speed internal RC (HSI), AHB prescaler used to reduce the frequency	36 MHz	13.7	2.6	
			24 MHz	9.3	1.8	
			16 MHz	6.3	1.3	
			8 MHz	2.7	0.6	
			4 MHz	1.6	0.5	
			2 MHz	1	0.46	
			1 MHz	0.8	0.44	
			500 kHz	0.6	0.43	
			125 kHz	0.5	0.42	

1. Typical values are measures at T<sub>A</sub> = 25 °C, V<sub>DD</sub> = 3.3 V.

2. Add an additional power consumption of 0.8 mA per ADC for the analog part. In applications, this consumption occurs only while the ADC is on (ADON bit is set in the ADC\_CR2 register).

3. External clock is 8 MHz and PLL is on when f<sub>HCLK</sub> > 8 MHz.

### On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in [Table 19](#). The MCU is placed under the following conditions:

- all I/O pins are in input mode with a static value at V<sub>DD</sub> or V<sub>SS</sub> (no load)
- all peripherals are disabled unless otherwise mentioned
- the given value is calculated by measuring the current consumption
  - with all peripherals clocked off
  - with one peripheral clocked on (with only the clock applied)
- ambient operating temperature and V<sub>DD</sub> supply voltage conditions summarized in [Table 6](#)

**Table 19. Peripheral current consumption<sup>(1)</sup>**

Peripheral		Typical consumption at 25 °C	Unit
AHB	ETH_MAC	5.2	mA
	OTG_FS	7.7	
APB1	TIM2	1.5	
	TIM3	1.5	
	TIM4	1.5	
	TIM5	1.5	
	TIM6	0.6	
	TIM7	0.3	
	SPI2	0.2	
	USART2	0.5	
	USART3	0.5	
	UART4	0.5	
	UART5	0.5	
	I2C1	0.5	
	I2C2	0.5	
	CAN1	0.8	
	CAN2	0.8	
	DAC	0.4	
APB2	GPIO A	0.5	mA
	GPIO B	0.5	
	GPIO C	0.5	
	GPIO D	0.5	
	GPIO E	0.5	
	ADC1 <sup>(2)</sup>	2.1	
	ADC2 <sup>(2)</sup>	2.0	
	TIM1	1.7	
	SPI1	0.4	
	USART1	0.9	

1.  $f_{HCLK} = 72 \text{ MHz}$ ,  $f_{APB1} = f_{HCLK}/2$ ,  $f_{APB2} = f_{HCLK}$ , default prescaler value for each peripheral.

2. Specific conditions for ADC:  $f_{HCLK} = 56 \text{ MHz}$ ,  $f_{APB1} = f_{HCLK}/2$ ,  $f_{APB2} = f_{HCLK}$ ,  $f_{ADCCLK} = f_{APB2}/4$ , ADON bit in the ADC\_CR2 register is set to 1.

### 5.3.6 External clock source characteristics

#### High-speed external user clock generated from an external source

The characteristics given in [Table 20](#) result from tests performed using an high-speed external clock source, and under ambient temperature and supply voltage conditions summarized in [Table 9](#).

**Table 20. High-speed external user clock characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSE\_ext}$	External user clock source frequency <sup>(1)</sup>		1	8	50	MHz
$V_{HSEH}$	OSC_IN input pin high level voltage		$0.7V_{DD}$		$V_{DD}$	V
$V_{HSEL}$	OSC_IN input pin low level voltage		$V_{SS}$		$0.3V_{DD}$	
$t_{w(HSE)}$ $t_{w(HSE)}$	OSC_IN high or low time <sup>(1)</sup>		5			ns
$t_{r(HSE)}$ $t_{f(HSE)}$	OSC_IN rise or fall time <sup>(1)</sup>				20	
$C_{in(HSE)}$	OSC_IN input capacitance <sup>(1)</sup>			5		pF
$DuCy_{(HSE)}$	Duty cycle		45		55	%
$I_L$	OSC_IN Input leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$			$\pm 1$	$\mu A$

1. Guaranteed by design, not tested in production.

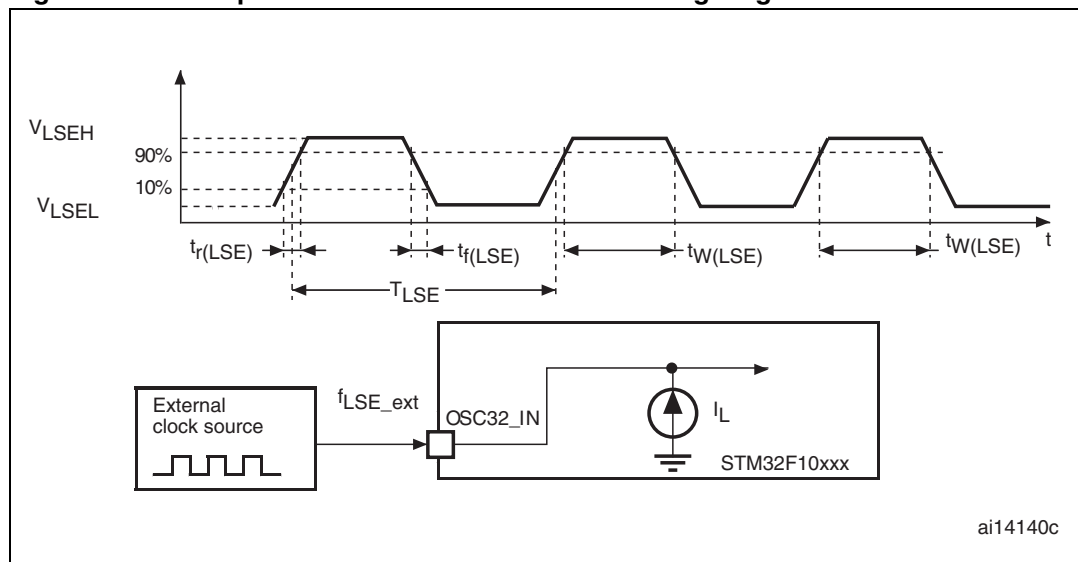

#### Low-speed external user clock generated from an external source

The characteristics given in [Table 21](#) result from tests performed using an low-speed external clock source, and under ambient temperature and supply voltage conditions summarized in [Table 9](#).

**Table 21. Low-speed external user clock characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSE\_ext}$	User External clock source frequency <sup>(1)</sup>			32.768	1000	kHz
$V_{LSEH}$	OSC32_IN input pin high level voltage		$0.7V_{DD}$		$V_{DD}$	V
$V_{LSEL}$	OSC32_IN input pin low level voltage		$V_{SS}$		$0.3V_{DD}$	
$t_{w(LSE)}$ $t_{w(LSE)}$	OSC32_IN high or low time <sup>(1)</sup>		450			ns
$t_{r(LSE)}$ $t_{f(LSE)}$	OSC32_IN rise or fall time <sup>(1)</sup>				50	
$C_{in(LSE)}$	OSC32_IN input capacitance <sup>(1)</sup>			5		pF
$DuCy_{(LSE)}$	Duty cycle		30		70	%
$I_L$	OSC32_IN Input leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$			$\pm 1$	$\mu A$

1. Guaranteed by design, not tested in production.

**Figure 14. High-speed external clock source AC timing diagram****Figure 15. Low-speed external clock source AC timing diagram****High-speed external clock generated from a crystal/ceramic resonator**

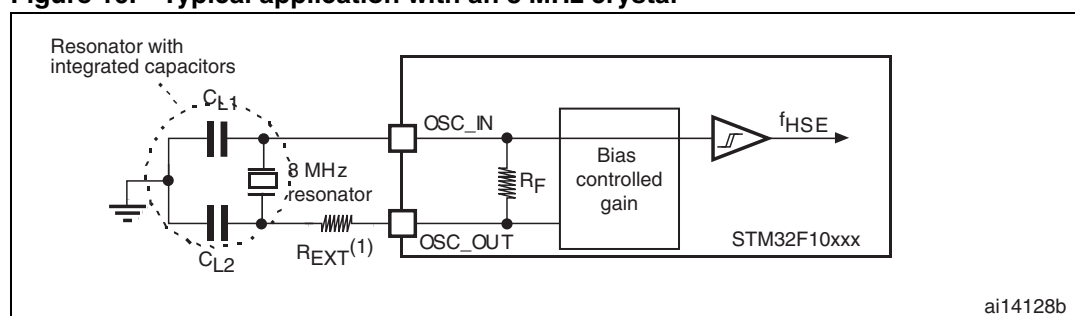

The high-speed external (HSE) clock can be supplied with a 3 to 25 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in [Table 22](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

**Table 22. HSE 3-25 MHz oscillator characteristics<sup>(1) (2)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{OSC\_IN}$	Oscillator frequency		3		25	MHz
$R_F$	Feedback resistor			200		k $\Omega$
C	Recommended load capacitance versus equivalent serial resistance of the crystal ( $R_S$ ) <sup>(3)</sup>	$R_S = 30 \Omega$		30		pF
$i_2$	HSE driving current	$V_{DD} = 3.3 V$ , $V_{IN} = V_{SS}$ with 30 pF load			1	mA
$g_m$	Oscillator transconductance	Startup	25			mA/V
$t_{SU(HSE)}$ <sup>(4)</sup>	Startup time	$V_{DD}$ is stabilized		2		ms

1. Resonator characteristics given by the crystal/ceramic resonator manufacturer.
2. Based on characterization, not tested in production.
3. The relatively low value of the RF resistor offers a good protection against issues resulting from use in a humid environment, due to the induced leakage and the bias condition change. However, it is recommended to take this point into account if the MCU is used in tough humidity conditions.
4.  $t_{SU(HSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer

For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high-quality external ceramic capacitors in the 5 pF to 25 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see [Figure 16](#)).  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ . PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing  $C_{L1}$  and  $C_{L2}$ . Refer to the application note AN2867 "Oscillator design guide for ST microcontrollers" available from the ST website [www.st.com](http://www.st.com).

**Figure 16. Typical application with an 8 MHz crystal**

1.  $R_{EXT}$  value depends on the crystal characteristics.

### Low-speed external clock generated from a crystal/ceramic resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in [Table 23](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal

resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

**Table 23. LSE oscillator characteristics ( $f_{LSE} = 32.768$  kHz) <sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$R_F$	Feedback resistor			5		MΩ
$C^{(2)}$	Recommended load capacitance versus equivalent serial resistance of the crystal ( $R_S$ ) <sup>(3)</sup>	$R_S = 30$ kΩ			15	pF
$I_2$	LSE driving current	$V_{DD} = 3.3$ V, $V_{IN} = V_{SS}$			1.4	μA
$g_m$	Oscillator Transconductance		5			μA/V
$t_{SU(LSE)}^{(4)}$	Startup time	$V_{DD}$ is stabilized	$T_A = 50$ °C	1.5		s
			$T_A = 25$ °C	2.5		
			$T_A = 10$ °C	4		
			$T_A = 0$ °C	6		
			$T_A = -10$ °C	10		
			$T_A = -20$ °C	17		
			$T_A = -30$ °C	32		
			$T_A = -40$ °C	60		

1. Based on characterization, not tested in production.

2. Refer to the note and caution paragraphs below the table, and to the application note AN2867 "Oscillator design guide for ST microcontrollers".

3. The oscillator selection can be optimized in terms of supply current using an high quality resonator with small  $R_S$  value for example MSIV-TIN32.768kHz. Refer to crystal manufacturer for more details

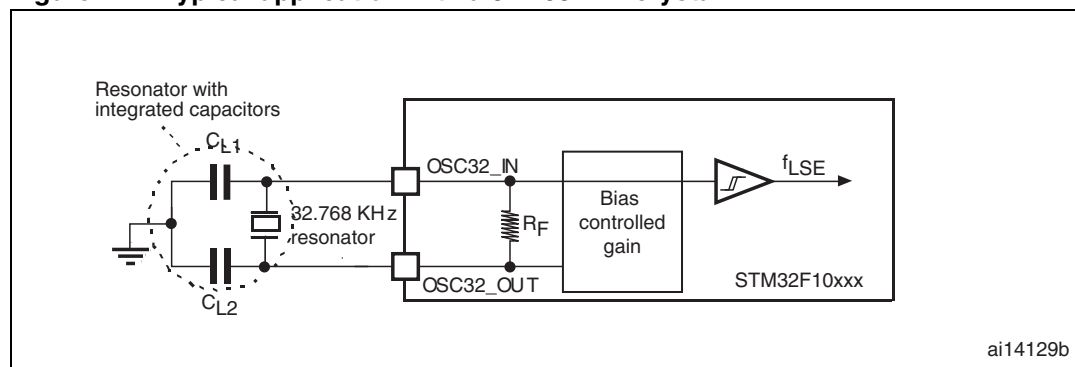

4.  $t_{SU(LSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal and it can vary significantly with the crystal manufacturer

**Note:** For  $C_{L1}$  and  $C_{L2}$  it is recommended to use high-quality external ceramic capacitors in the 5 pF to 15 pF range selected to match the requirements of the crystal or resonator (see [Figure 17](#)).  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ . Load capacitance  $C_L$  has the following formula:  $C_L = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{stray}$  where  $C_{stray}$  is the pin capacitance and board or trace PCB-related capacitance. Typically, it is between 2 pF and 7 pF.

**Caution:** To avoid exceeding the maximum value of  $C_{L1}$  and  $C_{L2}$  (15 pF) it is strongly recommended to use a resonator with a load capacitance  $C_L \leq 7$  pF. Never use a resonator with a load capacitance of 12.5 pF.

**Example:** if you choose a resonator with a load capacitance of  $C_L = 6$  pF, and  $C_{stray} = 2$  pF, then  $C_{L1} = C_{L2} = 8$  pF.

**Figure 17. Typical application with a 32.768 kHz crystal**

### 5.3.7 Internal clock source characteristics

The parameters given in [Table 24](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

#### High-speed internal (HSI) RC oscillator

**Table 24. HSI oscillator characteristics <sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSI}$	Frequency			8		MHz
$DuCy_{(HSI)}$	Duty cycle		45		55	%
$ACC_{HSI}$	Accuracy of the HSI oscillator	User-trimmed with the RCC_CR register <sup>(2)</sup>			1 <sup>(3)</sup>	%
		Factory-calibrated <sup>(4)</sup>	$T_A = -40$ to $105\text{ }^{\circ}\text{C}$	-2	2.5	%
			$T_A = -10$ to $85\text{ }^{\circ}\text{C}$	-1.5	2.2	%
			$T_A = 0$ to $70\text{ }^{\circ}\text{C}$	-1.3	2	%
			$T_A = 25\text{ }^{\circ}\text{C}$	-1.1	1.8	%
$t_{su(HSI)}^{(4)}$	HSI oscillator startup time		1		2	$\mu\text{s}$
$I_{DD(HSI)}^{(4)}$	HSI oscillator power consumption			80	100	$\mu\text{A}$

1.  $V_{DD} = 3.3\text{ V}$ ,  $T_A = -40$  to  $105\text{ }^{\circ}\text{C}$  unless otherwise specified.

2. Refer to application note AN2868 "STM32F10xxx internal RC oscillator (HSI) calibration" available from the ST website [www.st.com](http://www.st.com).

3. Guaranteed by design, not tested in production.

4. Based on characterization, not tested in production.

#### Low-speed internal (LSI) RC oscillator

**Table 25. LSI oscillator characteristics <sup>(1)</sup>**

Symbol	Parameter	Min	Typ	Max	Unit
$f_{LSI}^{(2)}$	Frequency	30	40	60	kHz
$t_{su(LSI)}^{(3)}$	LSI oscillator startup time			85	$\mu\text{s}$
$I_{DD(LSI)}^{(3)}$	LSI oscillator power consumption		0.65	1.2	$\mu\text{A}$

1.  $V_{DD} = 3\text{ V}$ ,  $T_A = -40$  to  $105\text{ }^{\circ}\text{C}$  unless otherwise specified.

2. Based on characterization, not tested in production.

3. Guaranteed by design, not tested in production.

#### Wakeup time from low-power mode

The wakeup times given in [Table 26](#) is measured on a wakeup phase with a 8-MHz HSI RC oscillator. The clock source used to wake up the device depends from the current operating mode:

- Stop or Standby mode: the clock source is the RC oscillator
- Sleep mode: the clock source is the clock that was set before entering Sleep mode.

All timings are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 26. Low-power mode wakeup timings**

Symbol	Parameter	Typ	Unit
$t_{WUSLEEP}^{(1)}$	Wakeup from Sleep mode	1.8	$\mu s$
$t_{WUSTOP}^{(1)}$	Wakeup from Stop mode (regulator in run mode)	3.6	$\mu s$
	Wakeup from Stop mode (regulator in low power mode)	5.4	
$t_{WUSTDBY}^{(1)}$	Wakeup from Standby mode	50	$\mu s$

1. The wakeup times are measured from the wakeup event to the point in which the user application code reads the first instruction.

### 5.3.8 PLL, PLL2 and PLL3 characteristics

The parameters given in [Table 27](#) and [Table 28](#) are derived from tests performed under temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 27. PLL characteristics**

Symbol	Parameter	Min <sup>(1)</sup>	Max <sup>(1)</sup>	Unit
$f_{PLL\_IN}$	PLL input clock <sup>(2)</sup>	3	12	MHz
	Pulse width at high level	30		ns
$f_{PLL\_OUT}$	PLL multiplier output clock	18	72	MHz
$f_{VCO\_OUT}$	PLL VCO output	36	144	MHz
$t_{LOCK}$	PLL lock time		350	$\mu s$
Jitter	Cycle-to-cycle jitter		300	ps

1. Based on characterization, not tested in production.
2. Take care of using the appropriate multiplier factors so as to have PLL input clock values compatible with the range defined by  $f_{PLL\_OUT}$ .

**Table 28. PLL2 and PLL3 characteristics**

Symbol	Parameter	Min <sup>(1)</sup>	Max <sup>(1)</sup>	Unit
$f_{PLL\_IN}$	PLL input clock <sup>(2)</sup>	3	5	MHz
	Pulse width at high level	30		ns
$f_{PLL\_OUT}$	PLL multiplier output clock	40	74	MHz
$f_{VCO\_OUT}$	PLL VCO output	80	148	MHz
$t_{LOCK}$	PLL lock time		350	$\mu s$
Jitter	Cycle-to-cycle jitter		400	ps

1. Based on characterization, not tested in production.
2. Take care of using the appropriate multiplier factors so as to have PLL input clock values compatible with the range defined by  $f_{PLL\_OUT}$ .

### 5.3.9 Memory characteristics

#### Flash memory

The characteristics are given at  $T_A = -40$  to  $105\text{ }^{\circ}\text{C}$  unless otherwise specified.

**Table 29. Flash memory characteristics**

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Typ	Max <sup>(1)</sup>	Unit
$t_{\text{prog}}$	16-bit programming time	$T_A = -40$ to $+105\text{ }^{\circ}\text{C}$	40	52.5	70	$\mu\text{s}$
$t_{\text{ERASE}}$	Page (1 KB) erase time	$T_A = -40$ to $+105\text{ }^{\circ}\text{C}$	20		40	ms
$t_{\text{ME}}$	Mass erase time	$T_A = -40$ to $+105\text{ }^{\circ}\text{C}$	20		40	ms
$I_{\text{DD}}$	Supply current	Read mode $f_{\text{HCLK}} = 72\text{ MHz}$ with 2 wait states, $V_{\text{DD}} = 3.3\text{ V}$			20	mA
		Write / Erase modes $f_{\text{HCLK}} = 72\text{ MHz}$ , $V_{\text{DD}} = 3.3\text{ V}$			5	mA
		Power-down mode / Halt, $V_{\text{DD}} = 3.0$ to $3.6\text{ V}$			50	$\mu\text{A}$
$V_{\text{prog}}$	Programming voltage		2		3.6	V

1. Guaranteed by design, not tested in production.

**Table 30. Flash memory endurance and data retention**

Symbol	Parameter	Conditions	Value			Unit
			Min <sup>(1)</sup>	Typ	Max	
$N_{\text{END}}$	Endurance	$T_A = -40$ to $+85\text{ }^{\circ}\text{C}$ (6 suffix versions) $T_A = -40$ to $+105\text{ }^{\circ}\text{C}$ (7 suffix versions)	10			kcycles
$t_{\text{RET}}$	Data retention	1 kcycle <sup>(2)</sup> at $T_A = 85\text{ }^{\circ}\text{C}$	30			Years
		1 kcycle <sup>(2)</sup> at $T_A = 105\text{ }^{\circ}\text{C}$	10			
		10 kcycles <sup>(2)</sup> at $T_A = 55\text{ }^{\circ}\text{C}$	20			

1. Based on characterization, not tested in production.

2. Cycling performed over the whole temperature range.

### 5.3.10 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

### Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB**: A burst of fast transient voltage (positive and negative) is applied to  $V_{DD}$  and  $V_{SS}$  through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in [Table 31](#). They are based on the EMS levels and classes defined in application note AN1709.

**Table 31. EMS characteristics**

Symbol	Parameter	Conditions	Level/Class
$V_{FESD}$	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , LQFP100, $T_A = +25\text{ °C}$ , $f_{HCLK} = 75\text{ MHz}$ , conforms to IEC 61000-4-2	2B
$V_{EFTB}$	Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , LQFP100, $T_A = +25\text{ °C}$ , $f_{HCLK} = 75\text{ MHz}$ , conforms to IEC 61000-4-2	4A

### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (control registers...)

#### Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

### Electromagnetic Interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling 2 LEDs through the I/O ports). This emission test is compliant with SAE IEC61967-2 standard which specifies the test board and the pin loading.

**Table 32. EMI characteristics**

Symbol	Parameter	Conditions	Monitored frequency band	Max vs. [f <sub>HSE</sub> /f <sub>HCLK</sub> ]		Unit
				8/48 MHz	8/72 MHz	
S <sub>EMI</sub>	Peak level	V <sub>DD</sub> = 3.3 V, T <sub>A</sub> = 25 °C, LQFP100 package compliant with IEC61967-2	0.1 to 30 MHz	9	9	dBμV
			30 to 130 MHz	26	13	
			130 MHz to 1GHz	25	31	
			SAE EMI Level	4	4	-

### 5.3.11 Absolute maximum ratings (electrical sensitivity)

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

#### Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n+1) supply pins). This test conforms to the JESD22-A114/C101 standard.

**Table 33. ESD absolute maximum ratings**

Symbol	Ratings	Conditions	Class	Maximum value <sup>(1)</sup>	Unit
V <sub>ESD(HBM)</sub>	Electrostatic discharge voltage (human body model)	T <sub>A</sub> = +25 °C conforming to JESD22-A114	2	2000	V
V <sub>ESD(CDM)</sub>	Electrostatic discharge voltage (charge device model)	T <sub>A</sub> = +25 °C conforming to JESD22-C101	II	500	

1. Based on characterization results, not tested in production.

#### Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with EIA/JESD 78A IC latch-up standard.

**Table 34. Electrical sensitivities**

Symbol	Parameter	Conditions	Class
LU	Static latch-up class	T <sub>A</sub> = +105 °C conforming to JESD78A	II level A

### 5.3.12 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below  $V_{SS}$  or above  $V_{DD}$  (for standard, 3 V-capable I/O pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

#### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit ( $>5$  LSB TUE), out of spec current injection on adjacent pins or other functional failure (for example reset, oscillator frequency deviation).

The test results are given in [Table 35](#)

**Table 35. I/O current injection susceptibility**

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
$I_{INJ}$	Injected current on OSC_IN32, OSC_OUT32, PA4, PA5, PC13	-0	+0	mA
	Injected current on all FT pins	-5	+0	
	Injected current on any other pin	-5	+5	

### 5.3.13 I/O port characteristics

#### General input/output characteristics

Unless otherwise specified, the parameters given in [Table 36](#) are derived from tests performed under the conditions summarized in [Table 9](#). All I/Os are CMOS and TTL compliant.

**Table 36. I/O static characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL}$	Standard IO input low level voltage		-0.3		$0.28 \cdot (V_{DD} - 2 \text{ V}) + 0.8 \text{ V}$	V
	IO FT <sup>(1)</sup> input low level voltage		-0.3		$0.32 \cdot (V_{DD} - 2 \text{ V}) + 0.75 \text{ V}$	V
$V_{IH}$	Standard IO input high level voltage		$0.41 \cdot (V_{DD} - 2 \text{ V}) + 1.3 \text{ V}$		$V_{DD} + 0.3$	V
	IO FT <sup>(1)</sup> input high level voltage	$V_{DD} > 2 \text{ V}$	$0.42 \cdot (V_{DD} - 2 \text{ V}) + 1 \text{ V}$		5.5	V
		$V_{DD} \leq 2 \text{ V}$			5.2	

Table 36. I/O static characteristics

Symbol	Parameter		Conditions	Min	Typ	Max	Unit
$V_{\text{hys}}$	Standard IO Schmitt trigger voltage hysteresis <sup>(2)</sup>			200			mV
	IO FT Schmitt trigger voltage hysteresis <sup>(2)</sup>			5% $V_{\text{DD}}$ <sup>(3)</sup>			mV
$I_{\text{Ikg}}$	Input leakage current <sup>(4)</sup>		$V_{\text{SS}} \leq V_{\text{IN}} \leq V_{\text{DD}}$ Standard I/Os			$\pm 1$	$\mu\text{A}$
			$V_{\text{IN}} = 5\text{ V}$ , I/O FT			3	
$R_{\text{PU}}$	Weak pull-up equivalent resistor <sup>(5)</sup>	All pins except for PA10	$V_{\text{IN}} = V_{\text{SS}}$	30	40	50	$\text{k}\Omega$
		PA10		8	11	15	
$R_{\text{PD}}$	Weak pull-down equivalent resistor <sup>(5)</sup>	All pins except for PA10	$V_{\text{IN}} = V_{\text{DD}}$	30	40	50	$\text{k}\Omega$
		PA10		8	11	15	
$C_{\text{IO}}$	I/O pin capacitance				5		pF

1. FT = Five-volt tolerant. In order to sustain a voltage higher than  $V_{\text{DD}}+0.3$  the internal pull-up/pull-down resistors must be disabled.
2. Hysteresis voltage between Schmitt trigger switching levels. Based on characterization, not tested in production.
3. With a minimum of 100 mV.
4. Leakage could be higher than max. if negative current is injected on adjacent pins.
5. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This MOS/NMOS contribution to the series resistance is minimum (~10% order).

All I/Os are CMOS and TTL compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters. The coverage of these requirements is shown in [Figure 18](#) and [Figure 19](#) for standard I/Os, and in [Figure 20](#) and [Figure 21](#) for 5 V tolerant I/Os.

Figure 18. Standard I/O input characteristics - CMOS port

Figure 19. Standard I/O input characteristics - TTL port

Figure 20. 5 V tolerant I/O input characteristics - CMOS port

Figure 21. 5 V tolerant I/O input characteristics - TTL port

## Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to  $\pm 8$  mA, and sink or source up to  $\pm 20$  mA (with a relaxed  $V_{OL}/V_{OH}$ ).

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in [Section 5.2](#):

- The sum of the currents sourced by all the I/Os on  $V_{DD}$ , plus the maximum Run consumption of the MCU sourced on  $V_{DD}$ , cannot exceed the absolute maximum rating  $I_{VDD}$  (see [Table 7](#)).
- The sum of the currents sunk by all the I/Os on  $V_{SS}$  plus the maximum Run consumption of the MCU sunk on  $V_{SS}$  cannot exceed the absolute maximum rating  $I_{VSS}$  (see [Table 7](#)).

## Output voltage levels

Unless otherwise specified, the parameters given in [Table 37](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#). All I/Os are CMOS and TTL compliant.

**Table 37. Output voltage characteristics**

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{OL}^{(1)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	TTL port $I_{IO} = +8$ mA $2.7\text{ V} < V_{DD} < 3.6\text{ V}$		0.4	V
$V_{OH}^{(2)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		$V_{DD}-0.4$		
$V_{OL}^{(1)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	CMOS port $I_{IO} = +8$ mA $2.7\text{ V} < V_{DD} < 3.6\text{ V}$		0.4	V
$V_{OH}^{(2)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		2.4		
$V_{OL}^{(1)(3)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	$I_{IO} = +20$ mA $2.7\text{ V} < V_{DD} < 3.6\text{ V}$		1.3	V
$V_{OH}^{(2)(3)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		$V_{DD}-1.3$		
$V_{OL}^{(1)(3)}$	Output low level voltage for an I/O pin when 8 pins are sunk at same time	$I_{IO} = +6$ mA $2\text{ V} < V_{DD} < 2.7\text{ V}$		0.4	V
$V_{OH}^{(2)(3)}$	Output high level voltage for an I/O pin when 8 pins are sourced at same time		$V_{DD}-0.4$		

1. The  $I_{IO}$  current sunk by the device must always respect the absolute maximum rating specified in [Table 7](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VSS}$ .
2. The  $I_{IO}$  current sourced by the device must always respect the absolute maximum rating specified in [Table 7](#) and the sum of  $I_{IO}$  (I/O ports and control pins) must not exceed  $I_{VDD}$ .
3. Based on characterization data, not tested in production.

### Input/output AC characteristics

The definition and values of input/output AC characteristics are given in [Figure 22](#) and [Table 38](#), respectively.

Unless otherwise specified, the parameters given in [Table 38](#) are derived from tests performed under the ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

**Table 38. I/O AC characteristics<sup>(1)</sup>**

MODEx[1:0] bit value <sup>(1)</sup>	Symbol	Parameter	Conditions	Min	Max	Unit
10	$f_{\max(\text{IO})\text{out}}$	Maximum frequency <sup>(2)</sup>	$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		2	MHz
	$t_{f(\text{IO})\text{out}}$	Output high to low level fall time	$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		125 <sup>(3)</sup>	ns
	$t_{r(\text{IO})\text{out}}$	Output low to high level rise time			125 <sup>(3)</sup>	
01	$f_{\max(\text{IO})\text{out}}$	Maximum frequency <sup>(2)</sup>	$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		10	MHz
	$t_{f(\text{IO})\text{out}}$	Output high to low level fall time	$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$		25 <sup>(3)</sup>	ns
	$t_{r(\text{IO})\text{out}}$	Output low to high level rise time			25 <sup>(3)</sup>	
11	$F_{\max(\text{IO})\text{out}}$	Maximum frequency <sup>(2)</sup>	$C_L = 30 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		50	MHz
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		30	MHz
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 2.7 \text{ V}$		20	MHz
	$t_{f(\text{IO})\text{out}}$	Output high to low level fall time	$C_L = 30 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		5 <sup>(3)</sup>	ns
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		8 <sup>(3)</sup>	
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 2.7 \text{ V}$		12 <sup>(3)</sup>	
	$t_{r(\text{IO})\text{out}}$	Output low to high level rise time	$C_L = 30 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		5 <sup>(3)</sup>	
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$		8 <sup>(3)</sup>	
			$C_L = 50 \text{ pF}$ , $V_{DD} = 2 \text{ V to } 2.7 \text{ V}$		12 <sup>(3)</sup>	
-	$t_{\text{EXTI}pw}$	Pulse width of external signals detected by the EXTI controller		10		ns

1. The I/O speed is configured using the MODEx[1:0] bits. Refer to the STM32F10xxx reference manual for a description of GPIO Port configuration register.
2. The maximum frequency is defined in [Figure 22](#).
3. Guaranteed by design, not tested in production.

Figure 22. I/O AC characteristics definition

### 5.3.14 NRST pin characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor,  $R_{PU}$  (see [Table 36](#)).

Unless otherwise specified, the parameters given in [Table 39](#) are derived from tests performed under the ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

Table 39. NRST pin characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}^{(1)}$	NRST Input low level voltage		-0.5		0.8	V
$V_{IH(NRST)}^{(1)}$	NRST Input high level voltage		2		$V_{DD}+0.5$	
$V_{hys(NRST)}$	NRST Schmitt trigger voltage hysteresis			200		mV
$R_{PU}$	Weak pull-up equivalent resistor <sup>(2)</sup>	$V_{IN} = V_{SS}$	30	40	50	k $\Omega$
$V_{F(NRST)}^{(1)}$	NRST Input filtered pulse				100	ns
$V_{NF(NRST)}^{(1)}$	NRST Input not filtered pulse	$V_{DD} > 2.7 V$	300			ns

1. Guaranteed by design, not tested in production.

2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance must be minimum (~10% order).

**Figure 23. Recommended NRST pin protection**

2. The reset network protects the device against parasitic resets.
3. The user must ensure that the level on the NRST pin can go below the  $V_{IL(NRST)}$  max level specified in [Table 39](#). Otherwise the reset will not be taken into account by the device.

### 5.3.15 TIM timer characteristics

The parameters given in [Table 40](#) are guaranteed by design.

Refer to [Section 5.3.12: I/O current injection characteristics](#) for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

**Table 40. TIMx<sup>(1)</sup> characteristics**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time		1		$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72 \text{ MHz}$	13.9		ns
$f_{EXT}$	Timer external clock frequency on CH1 to CH4		0	$f_{TIMxCLK}/2$	MHz
		$f_{TIMxCLK} = 72 \text{ MHz}$	0	36	MHz
$Res_{TIM}$	Timer resolution			16	bit
$t_{COUNTER}$	16-bit counter clock period when internal clock is selected		1	65536	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72 \text{ MHz}$	0.0139	910	$\mu s$
$t_{MAX\_COUNT}$	Maximum possible count			$65536 \times 65536$	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 72 \text{ MHz}$		59.6	s

1. TIMx is used as a general term to refer to the TIM1, TIM2, TIM3, TIM4 and TIM5 timers.

### 5.3.16 Communications interfaces

#### I<sup>2</sup>C interface characteristics

Unless otherwise specified, the parameters given in [Table 41](#) are derived from tests performed under the ambient temperature,  $f_{\text{PCLK1}}$  frequency and  $V_{\text{DD}}$  supply voltage conditions summarized in [Table 9](#).

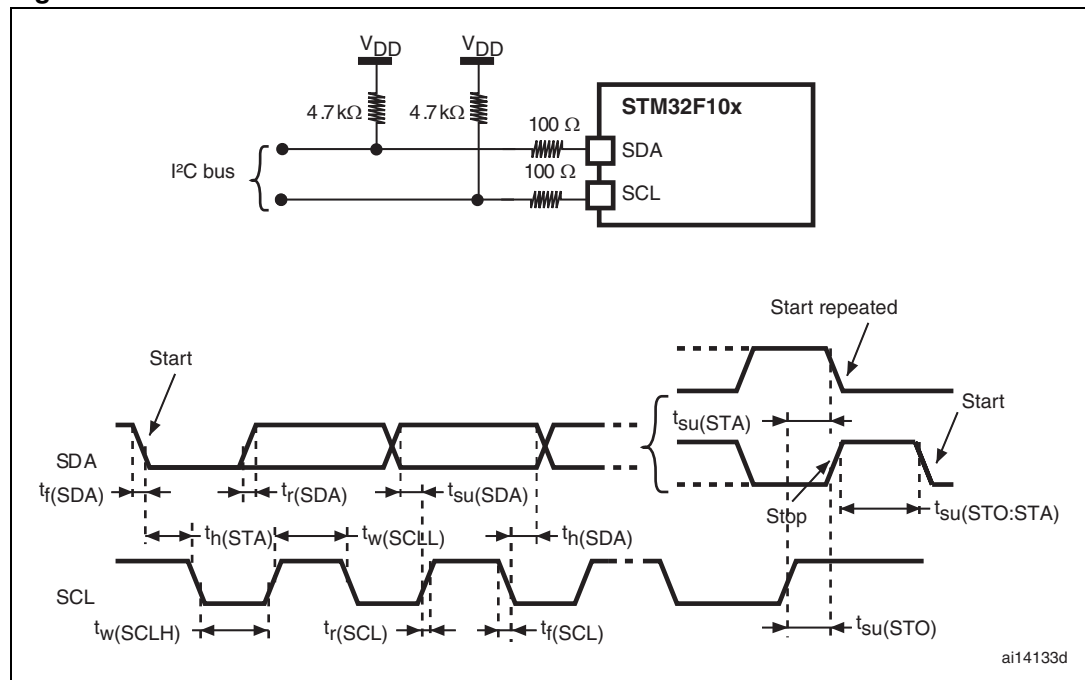

The STM32F105xx and STM32F107xx I<sup>2</sup>C interface meets the requirements of the standard I<sup>2</sup>C communication protocol with the following restrictions: the I/O pins SDA and SCL are mapped to are not “true” open-drain. When configured as open-drain, the PMOS connected between the I/O pin and  $V_{\text{DD}}$  is disabled, but is still present.

The I<sup>2</sup>C characteristics are described in [Table 41](#). Refer also to [Section 5.3.12: I/O current injection characteristics](#) for more details on the input/output alternate function characteristics (SDA and SCL).

**Table 41. I<sup>2</sup>C characteristics**

Symbol	Parameter	Standard mode I <sup>2</sup> C <sup>(1)</sup>		Fast mode I <sup>2</sup> C <sup>(1)(2)</sup>		Unit
		Min	Max	Min	Max	
$t_{\text{w}}(\text{SCLL})$	SCL clock low time	4.7		1.3		$\mu\text{s}$
$t_{\text{w}}(\text{SCLH})$	SCL clock high time	4.0		0.6		
$t_{\text{su}}(\text{SDA})$	SDA setup time	250		100		ns
$t_{\text{h}}(\text{SDA})$	SDA data hold time	0 <sup>(3)</sup>		0 <sup>(4)</sup>	900 <sup>(3)</sup>	
$t_{\text{r}}(\text{SDA})$ $t_{\text{r}}(\text{SCL})$	SDA and SCL rise time		1000	$20 + 0.1C_{\text{b}}$	300	
$t_{\text{f}}(\text{SDA})$ $t_{\text{f}}(\text{SCL})$	SDA and SCL fall time		300		300	
$t_{\text{h}}(\text{STA})$	Start condition hold time	4.0		0.6		$\mu\text{s}$
$t_{\text{su}}(\text{STA})$	Repeated Start condition setup time	4.7		0.6		
$t_{\text{su}}(\text{STO})$	Stop condition setup time	4.0		0.6		$\mu\text{s}$
$t_{\text{w}}(\text{STO:STA})$	Stop to Start condition time (bus free)	4.7		1.3		$\mu\text{s}$
$C_{\text{b}}$	Capacitive load for each bus line		400		400	pF

1. Guaranteed by design, not tested in production.
2.  $f_{\text{PCLK1}}$  must be at least 2 MHz to achieve standard mode I<sup>2</sup>C frequencies. It must be at least 4 MHz to achieve the fast mode I<sup>2</sup>C frequencies and it must be a multiple of 10 MHz in order to reach I<sup>2</sup>C fast mode maximum clock 400 kHz.
3. The maximum hold time of the Start condition has only to be met if the interface does not stretch the low period of SCL signal.
4. The device must internally provide a hold time of at least 300ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL.

Figure 24. I<sup>2</sup>C bus AC waveforms and measurement circuit

1. Measurement points are done at CMOS levels:  $0.3V_{DD}$  and  $0.7V_{DD}$ .

Table 42. SCL frequency ( $f_{PCLK1} = 36 \text{ MHz}$ ,  $V_{DD} = 3.3 \text{ V}$ )<sup>(1)(2)</sup>

$f_{SCL}$ (kHz)	I2C_CCR value
	$R_p = 4.7 \text{ k}\Omega$
400	0x801E
300	0x8028
200	0x803C
100	0x00B4
50	0x0168
20	0x0384

- $R_p$  = External pull-up resistance,  $f_{SCL}$  = I<sup>2</sup>C speed,
- For speeds around 200 kHz, the tolerance on the achieved speed is of  $\pm 5\%$ . For other speed ranges, the tolerance on the achieved speed  $\pm 2\%$ . These variations depend on the accuracy of the external components used to design the application.

## I<sup>2</sup>S - SPI interface characteristics

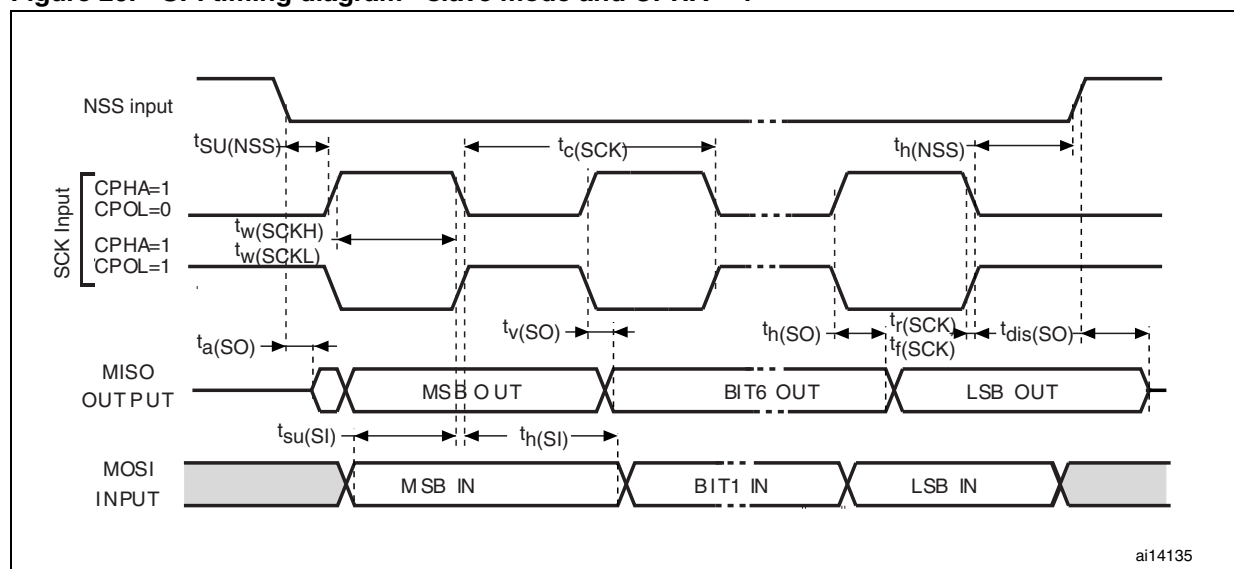

Unless otherwise specified, the parameters given in [Table 43](#) for SPI or in [Table 44](#) for I<sup>2</sup>S are derived from tests performed under the ambient temperature,  $f_{PCLKx}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 9](#).

Refer to [Section 5.3.12: I/O current injection characteristics](#) for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI and WS, CK, SD for I<sup>2</sup>S).

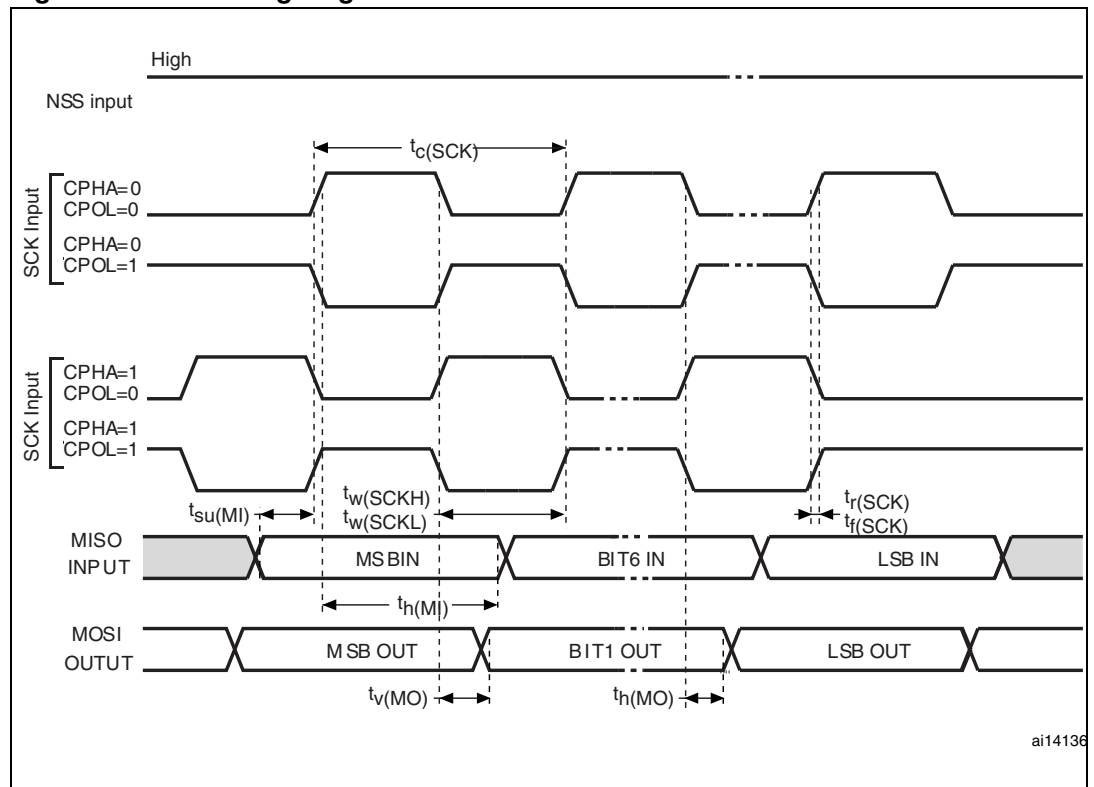

**Table 43. SPI characteristics**

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{SCK}$ $1/t_{c(SCK)}$	SPI clock frequency	Master mode		18	MHz
		Slave mode		18	
$t_{r(SCK)}$ $t_{f(SCK)}$	SPI clock rise and fall time	Capacitive load: C = 30 pF		8	ns
DuCy(SCK)	SPI slave input clock duty cycle	Slave mode	30	70	%
$t_{su(NSS)}$	NSS setup time	Slave mode	4 $t_{PCLK}$		ns
$t_{h(NSS)}$	NSS hold time	Slave mode	2 $t_{PCLK}$		
$t_{w(SCKH)}$ $t_{w(SCKL)}$	SCK high and low time	Master mode, $f_{PCLK} = 36$ MHz, presc = 4	50	60	
$t_{su(MI)}$	Data input setup time	Master mode	4		
$t_{su(SI)}$		Slave mode	5		
$t_{h(MI)}$	Data input hold time	Master mode	5		
$t_{h(SI)}$		Slave mode	5		
$t_{a(SO)}$	Data output access time	Slave mode, $f_{PCLK} = 20$ MHz		3* $t_{PCLK}$	
$t_{v(SO)}$	Data output valid time	Slave mode (after enable edge)		34	
$t_{v(MO)}$	Data output valid time	Master mode (after enable edge)		8	
$t_{h(SO)}$	Data output hold time	Slave mode (after enable edge)	32		
$t_{h(MO)}$		Master mode (after enable edge)	10

			I2S3	27		
$t_{v(SD\_MT)}^{(1)}$	Data output valid time	Master transmitter (after enable edge)	I2S2		5	
			I2S3		2	
$t_{h(SD\_MT)}^{(1)}$	Data output hold time	Master transmitter (after enable edge)	I2S2	11		
			I2S3	4		

1. Based on design simulation and/or characterization results, not tested in production.

Figure 28. I<sup>2</sup>S slave timing diagram (Philips protocol)<sup>(1)</sup>

1. Measurement points are done at CMOS levels:  $0.3 \times V_{DD}$  and  $0.7 \times V_{DD}$ .
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

Figure 29. I<sup>2</sup>S master timing diagram (Philips protocol)<sup>(1)</sup>

1. Based on characterization, not tested in production.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

**USB OTG FS characteristics**

The USB OTG interface is USB-IF certified (Full-Speed).

**Table 45. USB OTG FS startup time**

Symbol	Parameter	Max	Unit
$t_{\text{STARTUP}}^{(1)}$	USB OTG FS transceiver startup time	1	$\mu\text{s}$

1. Guaranteed by design, not tested in production.

**Table 46. USB OTG FS DC electrical characteristics**

Symbol	Parameter	Conditions	Min. <sup>(1)</sup>	Typ.	Max. <sup>(1)</sup>	Unit
<b>Input levels</b>	$V_{\text{DD}}$	USB OTG FS operating voltage	3.0 <sup>(2)</sup>		3.6	V
	$V_{\text{DI}}^{(3)}$	Differential input sensitivity	I(USBDP, USBDM)	0.2		V
	$V_{\text{CM}}^{(3)}$	Differential common mode range	Includes $V_{\text{DI}}$ range	0.8	2.5	
	$V_{\text{SE}}^{(3)}$	Single ended receiver threshold		1.3	2.0	
<b>Output levels</b>	$V_{\text{OL}}$	Static output level low	$R_{\text{L}}$ of 1.5 k $\Omega$ to 3.6 V <sup>(4)</sup>		0.3	V
	$V_{\text{OH}}$	Static output level high	$R_{\text{L}}$ of 15 k $\Omega$ to $V_{\text{SS}}^{(4)}$	2.8	3.6	
$R_{\text{PD}}$	Pull-down resistance on PA11, PA12	$V_{\text{IN}} = V_{\text{DD}}$	17	21	24	k $\Omega$
	Pull-down resistance on PA9		0.65	1.1	2.0	
$R_{\text{PU}}$	Pull-up resistance on PA12	$V_{\text{IN}} = V_{\text{SS}}$	1.5	1.8	2.1	
	Pull-up resistance on PA9	$V_{\text{IN}} = V_{\text{SS}}$	0.25	0.37	0.55	

1. All the voltages are measured from the local ground potential.
2. The STM32F105xx and STM32F107xx USB OTG FS functionality is ensured down to 2.7 V but not the full USB OTG FS electrical characteristics which are degraded in the 2.7-to-3.0 V  $V_{\text{DD}}$  voltage range.
3. Guaranteed by design, not tested in production.
4.  $R_{\text{L}}$  is the load connected on the USB OTG FS drivers

**Figure 30. USB OTG FS timings: definition of data signal rise and fall time**

**Table 47. USB OTG FS electrical characteristics<sup>(1)</sup>**

Driver characteristics					
Symbol	Parameter	Conditions	Min	Max	Unit
$t_r$	Rise time <sup>(2)</sup>	$C_L = 50 \text{ pF}$	4	20	ns
$t_f$	Fall time <sup>(2)</sup>	$C_L = 50 \text{ pF}$	4	20	ns
$t_{rfm}$	Rise/ fall time matching	$t_r/t_f$	90	110	%
$V_{CRS}$	Output signal crossover voltage		1.3	2.0	V

1. Guaranteed by design, not tested in production.
2. Measured from 10% to 90% of the data signal. For more detailed informations, please refer to USB Specification - Chapter 7 (version 2.0).

## Ethernet characteristics

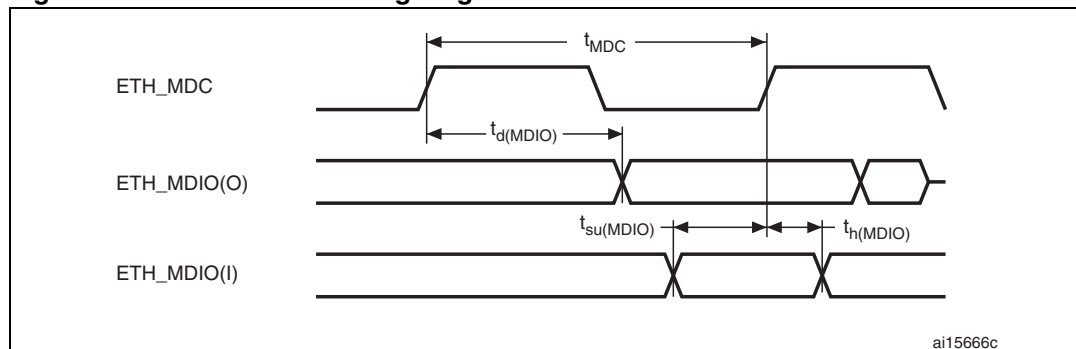

[Table 48](#) shows the Ethernet operating voltage.

**Table 48. Ethernet DC electrical characteristics**

Symbol	Parameter	Min. <sup>(1)</sup>	Max. <sup>(1)</sup>	Unit
Input level $V_{DD}$	Ethernet operating voltage	3.0	3.6	V

1. All the voltages are measured from the local ground potential.

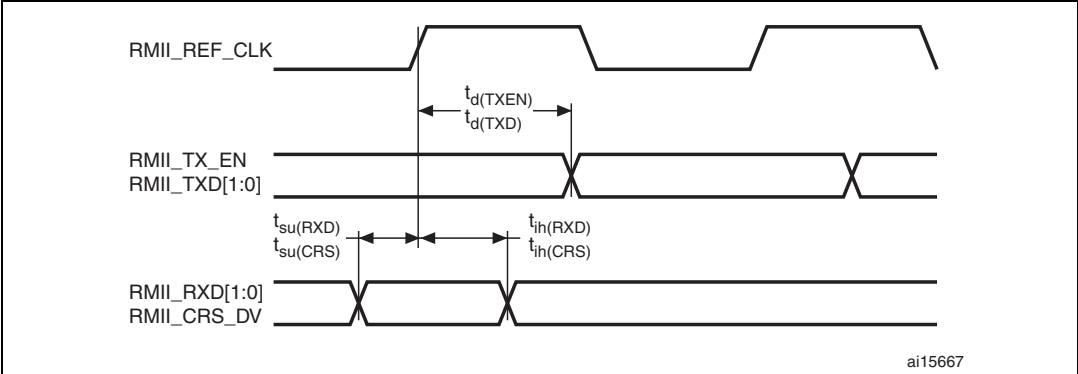

[Table 49](#) gives the list of Ethernet MAC signals for the SMI (station management interface) and [Figure 31](#) shows the corresponding timing diagram.

**Figure 31. Ethernet SMI timing diagram****Table 49. Dynamic characteristics: Ethernet MAC signals for SMI**

Symbol	Rating	Min	Typ	Max	Unit
$t_{MDC}$	MDC cycle time (1.71 MHz, AHB = 72 MHz)	583	583.5	584	ns
$t_{d(MDIO)}$	MDIO write data valid time	13.5	14.5	15.5	ns
$t_{su(MDIO)}$	Read data setup time	35			ns
$t_{h(MDIO)}$	Read data hold time	0			ns

[Table 50](#) gives the list of Ethernet MAC signals for the RMII and [Figure 32](#) shows the corresponding timing diagram.

**Figure 32. Ethernet RMII timing diagram**

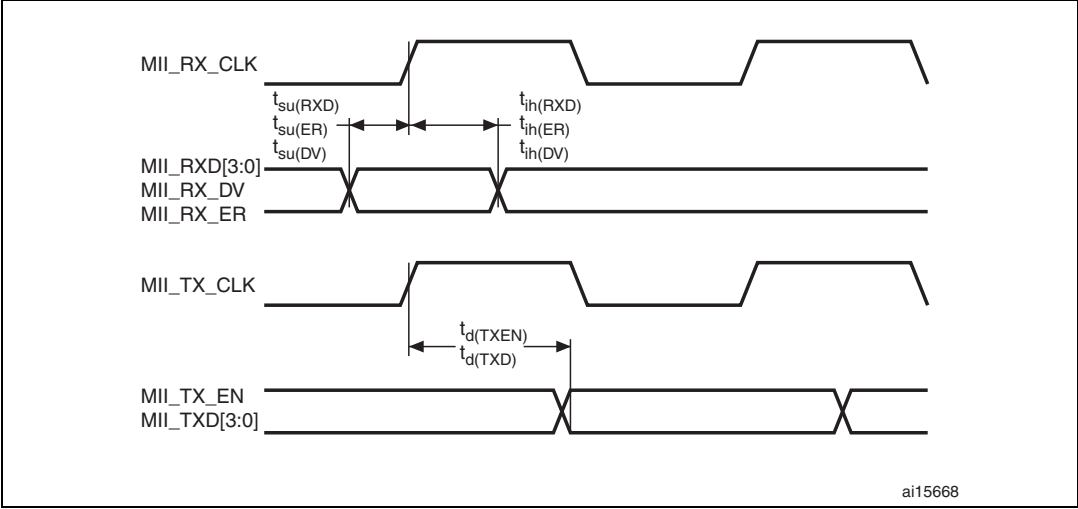

**Table 50. Dynamic characteristics: Ethernet MAC signals for RMII**

Symbol	Rating	Min	Typ	Max	Unit
$t_{su}(RXD)$	Receive data setup time	4			ns
$t_{ih}(RXD)$	Receive data hold time	2			ns
$t_{su}(DV)$	Carrier sense set-up time	4			ns
$t_{ih}(DV)$	Carrier sense hold time	2			ns
$t_d(TXEN)$	Transmit enable valid delay time	8	10	16	ns
$t_d(TXD)$	Transmit data valid delay time	7	10	16	ns

[Table 51](#) gives the list of Ethernet MAC signals for MII and [Figure 32](#) shows the corresponding timing diagram.

**Figure 33. Ethernet MII timing diagram**

**Table 51. Dynamic characteristics: Ethernet MAC signals for MII**

Symbol	Rating	Min	Typ	Max	Unit
$t_{su}(RXD)$	Receive data setup time	10			ns
$t_{ih}(RXD)$	Receive data hold time	10			ns
$t_{su}(DV)$	Data valid setup time	10			ns
$t_{ih}(DV)$	Data valid hold time	10			ns
$t_{su}(ER)$	Error setup time	10			ns
$t_{ih}(ER)$	Error hold time	10			ns
$t_d(TXEN)$	Transmit enable valid delay time	14	16	18	ns
$t_d(TXD)$	Transmit data valid delay time	13	16	20	ns

**CAN (controller area network) interface**

Refer to [Section 5.3.12: I/O current injection characteristics](#) for more details on the input/output alternate function characteristics (CANTX and CANRX).

**5.3.17 12-bit ADC characteristics**

Unless otherwise specified, the parameters given in [Table 52](#) are derived from tests performed under the ambient temperature,  $f_{PCLK2}$  frequency and  $V_{DDA}$  supply voltage conditions summarized in [Table 9](#).

*Note:* It is recommended to perform a calibration after each power-up.

**Table 52. ADC characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{DDA}$	Power supply		2.4		3.6	V
$V_{REF+}$	Positive reference voltage		2.4		$V_{DDA}$	V
$I_{VREF}$	Current on the $V_{REF}$ input pin			160 <sup>(1)</sup>	220 <sup>(1)</sup>	μA
$f_{ADC}$	ADC clock frequency		0.6		14	MHz
$f_S^{(2)}$	Sampling rate		0.05		1	MHz
$f_{TRIG}^{(2)}$	External trigger frequency	$f_{ADC} = 14$ MHz			823	kHz
					17	1/ $f_{ADC}$
$V_{AIN}$	Conversion voltage range <sup>(3)</sup>		0 ( $V_{SSA}$ or $V_{REF-}$ tied to ground)		$V_{REF+}$	V
$R_{AIN}^{(2)}$	External input impedance	See <a href="#">Equation 1</a> and <a href="#">Table 53</a> for details			50	kΩ
$R_{ADC}^{(2)}$	Sampling switch resistance				1	kΩ
$C_{ADC}^{(2)}$	Internal sample and hold capacitor				8	pF
$t_{CAL}^{(2)}$	Calibration time	$f_{ADC} = 14$ MHz	5.9			μs
			83			1/ $f_{ADC}$

**Table 52. ADC characteristics (continued)**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{lat}^{(2)}$	Injection trigger conversion latency	$f_{ADC} = 14\text{ MHz}$			0.214	$\mu\text{s}$
					$3^{(4)}$	$1/f_{ADC}$
$t_{latr}^{(2)}$	Regular trigger conversion latency	$f_{ADC} = 14\text{ MHz}$			0.143	$\mu\text{s}$
					$2^{(4)}$	$1/f_{ADC}$
$t_S^{(2)}$	Sampling time	$f_{ADC} = 14\text{ MHz}$	0.107		17.1	$\mu\text{s}$
			1.5		239.5	$1/f_{ADC}$
$t_{STAB}^{(2)}$	Power-up time		0	0	1	$\mu\text{s}$
$t_{CONV}^{(2)}$	Total conversion time (including sampling time)	$f_{ADC} = 14\text{ MHz}$	1		18	$\mu\text{s}$
			14 to 252 ( $t_S$ for sampling +12.5 for successive approximation)			$1/f_{ADC}$

1. Based on characterization, not tested in production.
2. Guaranteed by design, not tested in production.
3.  $V_{REF+}$  is internally connected to  $V_{DDA}$  and  $V_{REF-}$  is internally connected to  $V_{SSA}$ .
4. For external triggers, a delay of  $1/f_{PCLK2}$  must be added to the latency specified in [Table 52](#).

**Equation 1:  $R_{AIN}$  max formula**

$$R_{AIN} < \frac{T_S}{f_{ADC} \times C_{ADC} \times \ln(2^{N+2})} - R_{ADC}$$

The formula above ([Equation 1](#)) is used to determine the maximum external impedance allowed for an error below 1/4 of LSB. Here  $N = 12$  (from 12-bit resolution).

**Table 53.  $R_{AIN}$  max for  $f_{ADC} = 14\text{ MHz}^{(1)}$** 

$T_S$ (cycles)	$t_S$ ( $\mu\text{s}$ )	$R_{AIN}$ max ( $k\Omega$ )
1.5	0.11	0.4
7.5	0.54	5.9
13.5	0.96	11.4
28.5	2.04	25.2
41.5	2.96	37.2
55.5	3.96	50
71.5	5.11	NA
239.5	17.1	NA

1. Based on characterization, not tested in production.

**Table 54. ADC accuracy - limited test conditions<sup>(1)</sup>**

Symbol	Parameter	Test conditions	Typ	Max <sup>(2)</sup>	Unit
ET	Total unadjusted error	$f_{PCLK2} = 56 \text{ MHz}$ , $f_{ADC} = 14 \text{ MHz}$ , $R_{AIN} < 10 \text{ k}\Omega$ , $V_{DDA} = 3 \text{ V to } 3.6 \text{ V}$ $T_A = 25 \text{ }^\circ\text{C}$ Measurements made after ADC calibration	$\pm 1.3$	$\pm 2$	LSB
EO	Offset error		$\pm 1$	$\pm 1.5$	
EG	Gain error		$\pm 0.5$	$\pm 1.5$	
ED	Differential linearity error		$\pm 0.7$	$\pm 1$	
EL	Integral linearity error		$\pm 0.8$	$\pm 1.5$	

1. ADC DC accuracy values are measured after internal calibration.

2. Based on characterization, not tested in production.

**Table 55. ADC accuracy<sup>(1) (2)</sup>**

Symbol	Parameter	Test conditions	Typ	Max <sup>(3)</sup>	Unit
ET	Total unadjusted error	$f_{PCLK2} = 56 \text{ MHz}$ , $f_{ADC} = 14 \text{ MHz}$ , $R_{AIN} < 10 \text{ k}\Omega$ , $V_{DDA} = 2.4 \text{ V to } 3.6 \text{ V}$ Measurements made after ADC calibration	$\pm 2$	$\pm 5$	LSB
EO	Offset error		$\pm 1.5$	$\pm 2.5$	
EG	Gain error		$\pm 1.5$	$\pm 3$	
ED	Differential linearity error		$\pm 1$	$\pm 2$	
EL	Integral linearity error		$\pm 1.5$	$\pm 3$	

1. ADC DC accuracy values are measured after internal calibration.

2. Better performance could be achieved in restricted  $V_{DD}$ , frequency and temperature ranges.

3. Based on characterization, not tested in production.

**Note:**

ADC accuracy vs. negative injection current: Injecting a negative current on any of the standard (non-robust) analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative currents.

Any positive injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in [Section 5.3.12](#) does not affect the ADC accuracy.

Figure 34. ADC accuracy characteristics

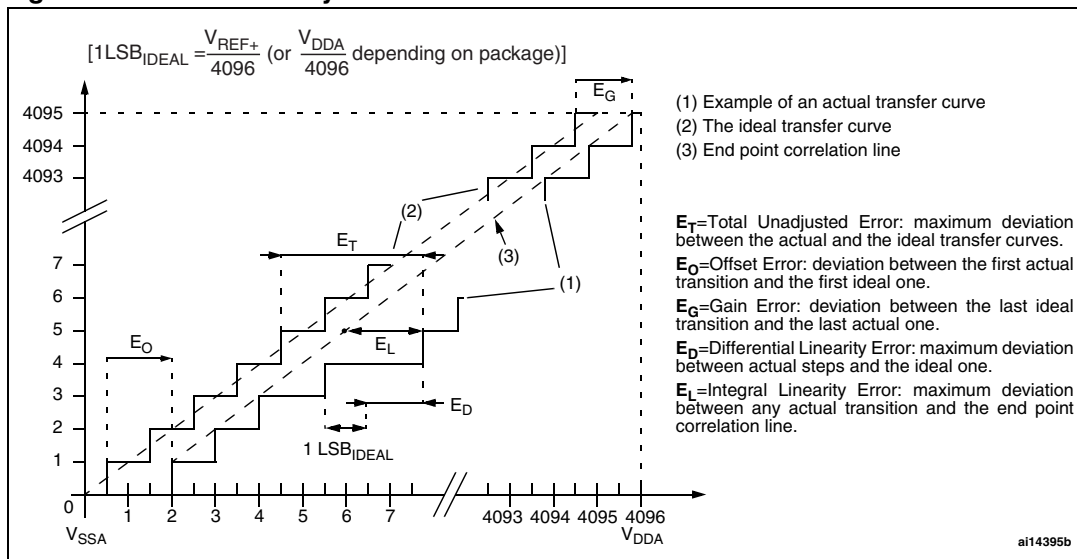

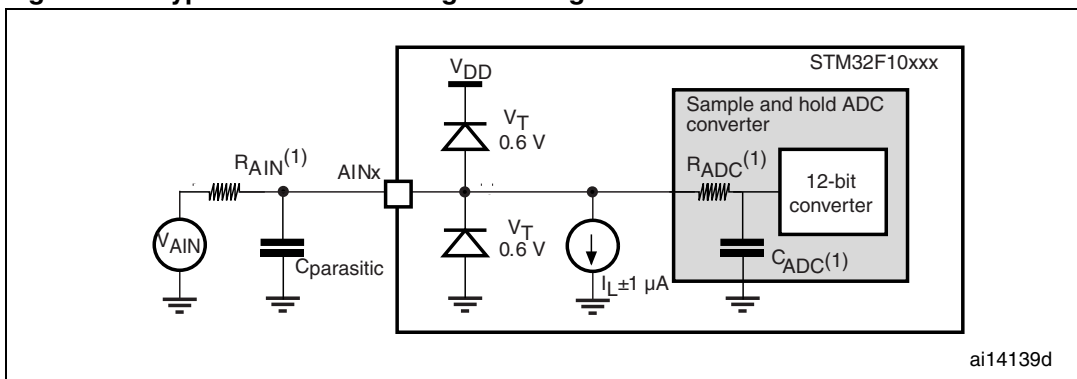

Figure 35. Typical connection diagram using the ADC

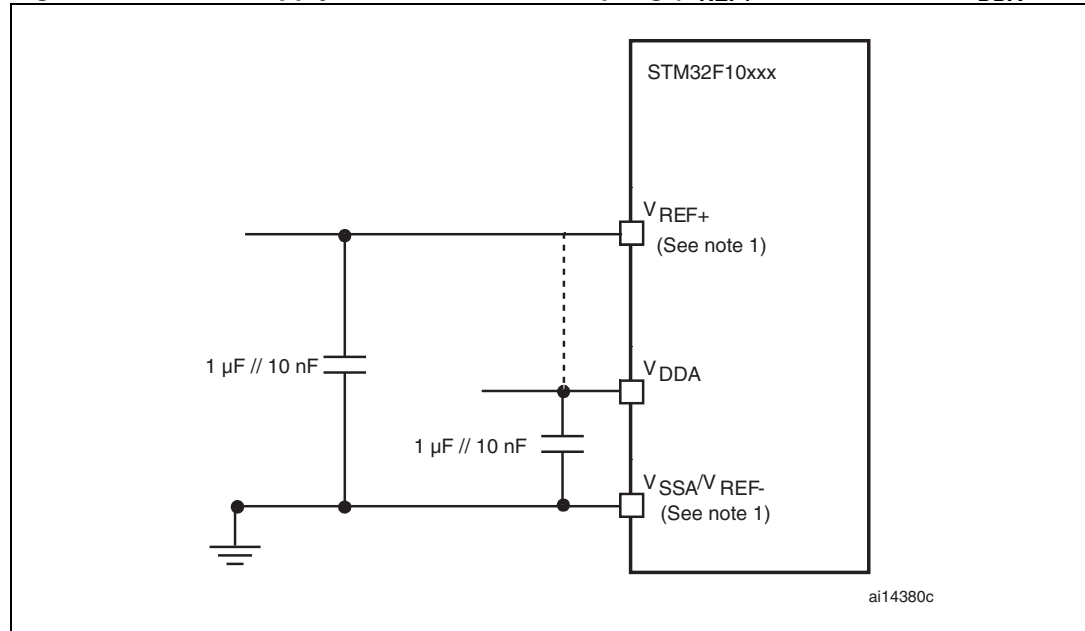

1. Refer to [Table 52](#) for the values of  $R_{AIN}$ ,  $R_{ADC}$  and  $C_{ADC}$ .
2.  $C_{parasitic}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high  $C_{parasitic}$  value will downgrade conversion accuracy. To remedy this,  $f_{ADC}$  should be reduced.

### General PCB design guidelines

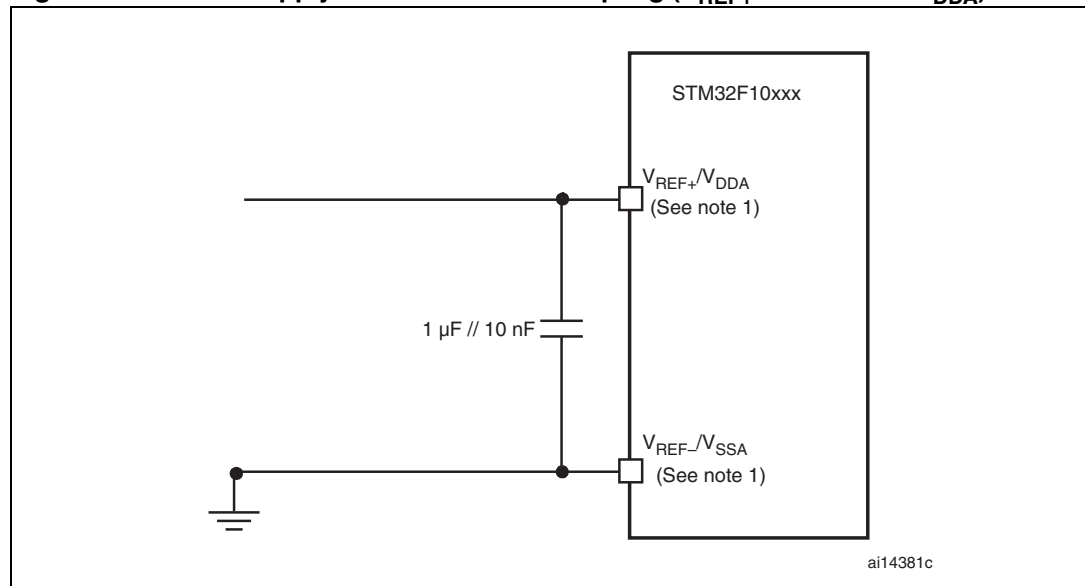

Power supply decoupling should be performed as shown in [Figure 36](#) or [Figure 37](#), depending on whether  $V_{REF+}$  is connected to  $V_{DDA}$  or not. The 10 nF capacitors should be ceramic (good quality). They should be placed as close as possible to the chip.

**Figure 36. Power supply and reference decoupling ( $V_{REF+}$  not connected to  $V_{DDA}$ )**

1.  $V_{REF+}$  and  $V_{REF-}$  inputs are available only on 100-pin packages.

**Figure 37. Power supply and reference decoupling ( $V_{REF+}$  connected to  $V_{DDA}$ )**

1.  $V_{REF+}$  and  $V_{REF-}$  inputs are available only on 100-pin packages.

### 5.3.18 DAC electrical specifications

**Table 56. DAC characteristics**

Symbol	Parameter	Min	Typ	Max	Unit	Comments
$V_{DDA}$	Analog supply voltage	2.4		3.6	V	
$V_{REF+}$	Reference supply voltage	2.4		3.6	V	$V_{REF+}$ must always be below $V_{DDA}$
$V_{SSA}$	Ground	0		0	V	
$R_{LOAD}^{(1)}$	Resistive load with buffer ON	5			k $\Omega$	
$R_O^{(1)}$	Impedance output with buffer OFF			15	k $\Omega$	When the buffer is OFF, the Minimum resistive load between DAC_OUT and $V_{SS}$ to have a 1% accuracy is 1.5 M $\Omega$
$C_{LOAD}^{(1)}$	Capacitive load			50	pF	Maximum capacitive load at DAC_OUT pin (when the buffer is ON).
$DAC\_OUT_{min}^{(1)}$	Lower DAC_OUT voltage with buffer ON	0.2			V	It gives the maximum output excursion of the DAC. It corresponds to 12-bit input code (0x0E0) to (0xF1C) at $V_{REF+} = 3.6$ V and (0x155) to (0xEAB) at $V_{REF+} = 2.4$ V
$DAC\_OUT_{max}^{(1)}$	Higher DAC_OUT voltage with buffer ON			$V_{DDA} - 0.2$	V	
$DAC\_OUT_{min}^{(1)}$	Lower DAC_OUT voltage with buffer OFF		0.5		mV	It gives the maximum output excursion of the DAC.
$DAC\_OUT_{max}^{(1)}$	Higher DAC_OUT voltage with buffer OFF			$V_{REF+} - 1LSB$	V	
$I_{DDVREF+}$	DAC DC current consumption in quiescent mode (Standby mode)			220	$\mu A$	With no load, worst code (0xF1C) at $V_{REF+} = 3.6$ V in terms of DC consumption on the inputs
$I_{DDA}$	DAC DC current consumption in quiescent mode (Standby mode)			380	$\mu A$	With no load, middle code (0x800) on the inputs
				480	$\mu A$	With no load, worst code (0xF1C) at $V_{REF+} = 3.6$ V in terms of DC consumption on the inputs
$DNL^{(2)}$	Differential non linearity Difference between two consecutive code-1LSB)			$\pm 0.5$	LSB	Given for the DAC in 10-bit configuration.
				$\pm 2$	LSB	Given for the DAC in 12-bit configuration.
$INL^{(2)}$	Integral non linearity (difference between measured value at Code i and the value at Code i on a line drawn between Code 0 and last Code 1023)			$\pm 1$	LSB	Given for the DAC in 10-bit configuration.
				$\pm 4$	LSB	Given for the DAC in 12-bit configuration.

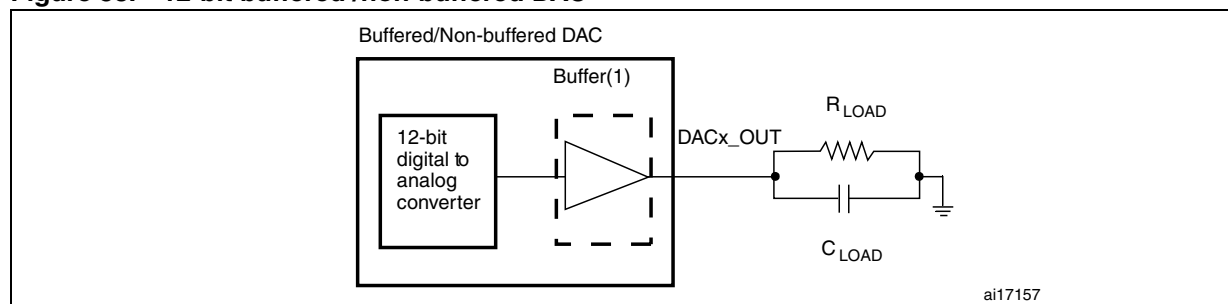

Table 56. DAC characteristics (continued)

Symbol	Parameter	Min	Typ	Max	Unit	Comments
Offset <sup>(2)</sup>	Offset error (difference between measured value at Code (0x800) and the ideal value = $V_{REF+}/2$ )			$\pm 10$	mV	Given for the DAC in 12-bit configuration
				$\pm 3$	LSB	Given for the DAC in 10-bit at $V_{REF+} = 3.6$ V
				$\pm 12$	LSB	Given for the DAC in 12-bit at $V_{REF+} = 3.6$ V
Gain error <sup>(2)</sup>	Gain error			$\pm 0.5$	%	Given for the DAC in 12bit configuration
$t_{SETTLING}^{(2)}$	Settling time (full scale: for a 10-bit input code transition between the lowest and the highest input codes when DAC_OUT reaches final value $\pm 1$ LSB)		3	4	$\mu$ s	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ k $\Omega$
Update rate <sup>(2)</sup>	Max frequency for a correct DAC_OUT change when small variation in the input code (from code i to i+1LSB)			1	MS/s	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ k $\Omega$
$t_{WAKEUP}^{(2)}$	Wakeup time from off state (Setting the ENx bit in the DAC Control register)		6.5	10	$\mu$ s	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ k $\Omega$ input code between lowest and highest possible ones.
PSRR+ <sup>(1)</sup>	Power supply rejection ratio (to $V_{DDA}$ ) (static DC measurement)		-67	-40	dB	No $R_{LOAD}$ , $C_{LOAD} = 50$ pF

1. Guaranteed by design, not tested in production.

2. Guaranteed by characterization, not tested in production.

Figure 38. 12-bit buffered /non-buffered DAC

1. The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC\_CR register.

### 5.3.19 Temperature sensor characteristics

**Table 57. TS characteristics**

Symbol	Parameter	Min	Typ	Max	Unit
$T_L^{(1)}$	$V_{SENSE}$ linearity with temperature		$\pm 1$	$\pm 2$	°C
Avg_Slope <sup>(1)</sup>	Average slope	4.0	4.3	4.6	mV/°C
$V_{25}^{(1)}$	Voltage at 25 °C	1.34	1.43	1.52	V
$t_{START}^{(2)}$	Startup time	4		10	μs
$T_{S\_temp}^{(3)(2)}$	ADC sampling time when reading the temperature			17.1	μs

1. Based on characterization, not tested in production.

2. Guaranteed by design, not tested in production.

3. Shortest sampling time can be determined in the application by multiple iterations.

## 6 Package characteristics

### 6.1 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK<sup>®</sup> is an ST trademark.

## 6.2 Thermal characteristics

The maximum chip junction temperature ( $T_{Jmax}$ ) must never exceed the values given in [Table 9: General operating conditions on page 35](#).

The maximum chip-junction temperature,  $T_J$  max, in degrees Celsius, may be calculated using the following equation:

$$T_J \text{ max} = T_A \text{ max} + (P_D \text{ max} \times \Theta_{JA})$$

Where:

- $T_A$  max is the maximum ambient temperature in °C,
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance, in °C/W,
- $P_D$  max is the sum of  $P_{INT}$  max and  $P_{I/O}$  max ( $P_D \text{ max} = P_{INT} \text{ max} + P_{I/O} \text{ max}$ ),
- $P_{INT}$  max is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.

$P_{I/O}$  max represents the maximum power dissipation on output pins where:

$$P_{I/O} \text{ max} = \Sigma (V_{OL} \times I_{OL}) + \Sigma ((V_{DD} - V_{OH}) \times I_{OH}),$$

taking into account the actual  $V_{OL} / I_{OL}$  and  $V_{OH} / I_{OH}$  of the I/Os at low and high level in the application.

**Table 61. Package thermal characteristics**

Symbol	Parameter	Value	Unit
$\Theta_{JA}$	<b>Thermal resistance junction-ambient</b> LQFP100 - 14 × 14 mm / 0.5 mm pitch	46	°C/W
	<b>Thermal resistance junction-ambient</b> LQFP64 - 10 × 10 mm / 0.5 mm pitch	45	
$\Theta_{JA}$	<b>Thermal resistance junction-ambient</b> LFBGA100 - 10 × 10 mm / 0.8 mm pitch	40	°C/W
	<b>Thermal resistance junction-ambient</b> LQFP100 - 14 × 14 mm / 0.5 mm pitch	46	
	<b>Thermal resistance junction-ambient</b> LQFP64 - 10 × 10 mm / 0.5 mm pitch	45	

### 6.2.1 Reference document

JESD51-2 Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air). Available from [www.jedec.org](http://www.jedec.org).

## 6.2.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the ordering information scheme shown in [Table 62: Ordering information scheme](#).

Each temperature range suffix corresponds to a specific guaranteed ambient temperature at maximum dissipation and, to a specific maximum junction temperature.

As applications do not commonly use the STM32F103xx at maximum dissipation, it is useful to calculate the exact power consumption and junction temperature to determine which temperature range will be best suited to the application.

The following examples show how to calculate the temperature range needed for a given application.

### Example 1: High-performance application

Assuming the following application conditions:

Maximum ambient temperature  $T_{Amax} = 82\text{ °C}$  (measured according to JESD51-2),  
 $I_{DDmax} = 50\text{ mA}$ ,  $V_{DD} = 3.5\text{ V}$ , maximum 20 I/Os used at the same time in output at low level with  $I_{OL} = 8\text{ mA}$ ,  $V_{OL} = 0.4\text{ V}$  and maximum 8 I/Os used at the same time in output at low level with  $I_{OL} = 20\text{ mA}$ ,  $V_{OL} = 1.3\text{ V}$

$$P_{INTmax} = 50\text{ mA} \times 3.5\text{ V} = 175\text{ mW}$$

$$P_{IOmax} = 20 \times 8\text{ mA} \times 0.4\text{ V} + 8 \times 20\text{ mA} \times 1.3\text{ V} = 272\text{ mW}$$

This gives:  $P_{INTmax} = 175\text{ mW}$  and  $P_{IOmax} = 272\text{ mW}$ :

$$P_{Dmax} = 175 + 272 = 447\text{ mW}$$

Thus:  $P_{Dmax} = 447\text{ mW}$

Using the values obtained in [Table 61](#)  $T_{Jmax}$  is calculated as follows:

– For LQFP100,  $46\text{ °C/W}$

$$T_{Jmax} = 82\text{ °C} + (46\text{ °C/W} \times 447\text{ mW}) = 82\text{ °C} + 20.6\text{ °C} = 102.6\text{ °C}$$

This is within the range of the suffix 6 version parts ( $-40 < T_J < 105\text{ °C}$ ).

In this case, parts must be ordered at least with the temperature range suffix 6 (see [Table 62: Ordering information scheme](#)).

### Example 2: High-temperature application

Using the same rules, it is possible to address applications that run at high ambient temperatures with a low dissipation, as long as junction temperature  $T_J$  remains within the specified range.

Assuming the following application conditions:

Maximum ambient temperature  $T_{Amax} = 115\text{ °C}$  (measured according to JESD51-2),  
 $I_{DDmax} = 20\text{ mA}$ ,  $V_{DD} = 3.5\text{ V}$ , maximum 20 I/Os used at the same time in output at low level with  $I_{OL} = 8\text{ mA}$ ,  $V_{OL} = 0.4\text{ V}$

$$P_{INTmax} = 20\text{ mA} \times 3.5\text{ V} = 70\text{ mW}$$

$$P_{IOmax} = 20 \times 8\text{ mA} \times 0.4\text{ V} = 64\text{ mW}$$

This gives:  $P_{INTmax} = 70\text{ mW}$  and  $P_{IOmax} = 64\text{ mW}$ :

$$P_{Dmax} = 70 + 64 = 134\text{ mW}$$

Thus:  $P_{Dmax} = 134\text{ mW}$

Using the values obtained in [Table 61](#)  $T_{Jmax}$  is calculated as follows:

– For LQFP100, 46 °C/W

$$T_{Jmax} = 115\text{ °C} + (46\text{ °C/W} \times 134\text{ mW}) = 115\text{ °C} + 6.2\text{ °C} = 121.2\text{ °C}$$

This is within the range of the suffix 7 version parts ( $-40 < T_J < 125\text{ °C}$ ).

In this case, parts must be ordered at least with the temperature range suffix 7 (see [Table 62: Ordering information scheme](#)).

**Figure 45. LQFP100  $P_D$  max vs.  $T_A$**

# 7 Part numbering

Table 62. Ordering information scheme

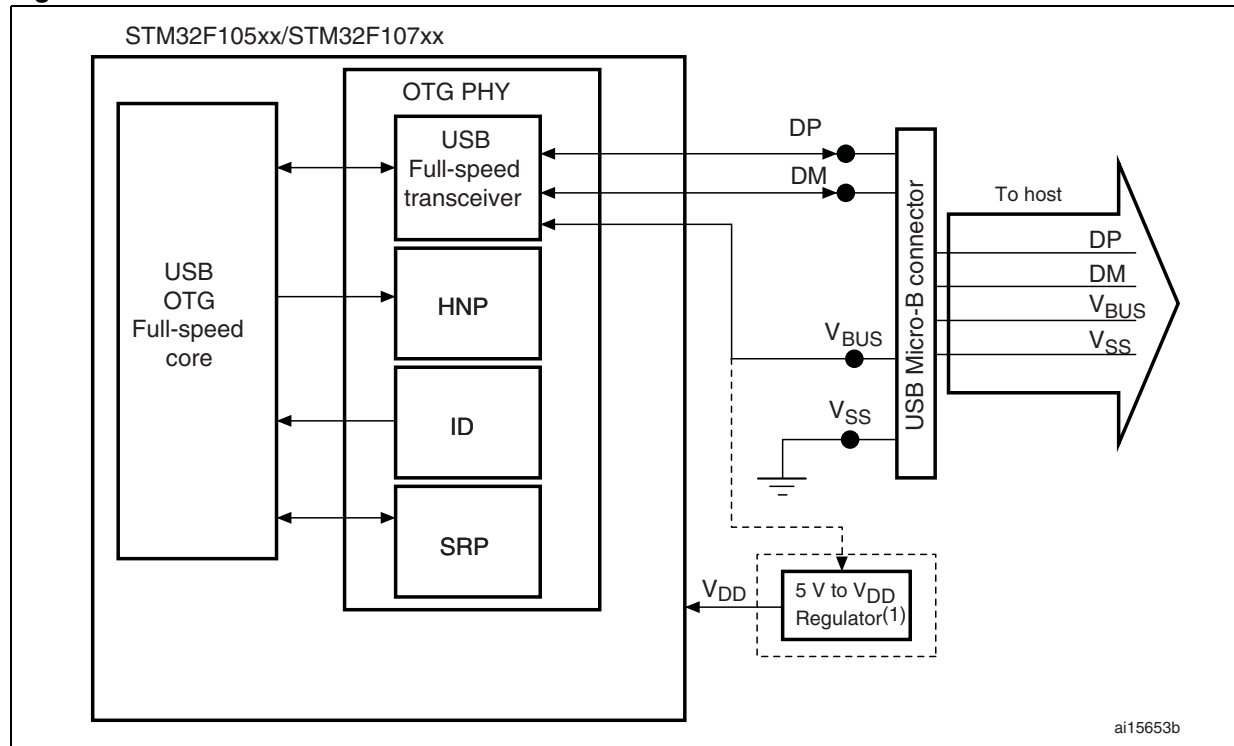

Example:	STM32	F	105	R	C	T	6	V	xxx
<b>Device family</b>									
STM32 = ARM-based 32-bit microcontroller									
<b>Product type</b>									
F = general-purpose									
<b>Device subfamily</b>									
105 = connectivity, USB OTG FS 107= connectivity, USB OTG FS & Ethernet									
<b>Pin count</b>									
R = 64 pins V = 100 pins									
<b>Flash memory size</b>									
8 = 64 Kbytes of Flash memory B = 128 Kbytes of Flash memory C = 256 Kbytes of Flash memory									
<b>Package</b>									
H = BGA T = LQFP									
<b>Temperature range</b>									
6 = Industrial temperature range, -40 to 85 °C. 7 = Industrial temperature range, -40 to 105 °C.									
<b>Software option</b>									
Internal code or Blank									
<b>Options</b>									
xxx = programmed parts TR = tape and real									

For a list of available options (speed, package, etc.) or for further information on any aspect of this device, please contact your nearest ST sales office.

## Appendix A Application block diagrams

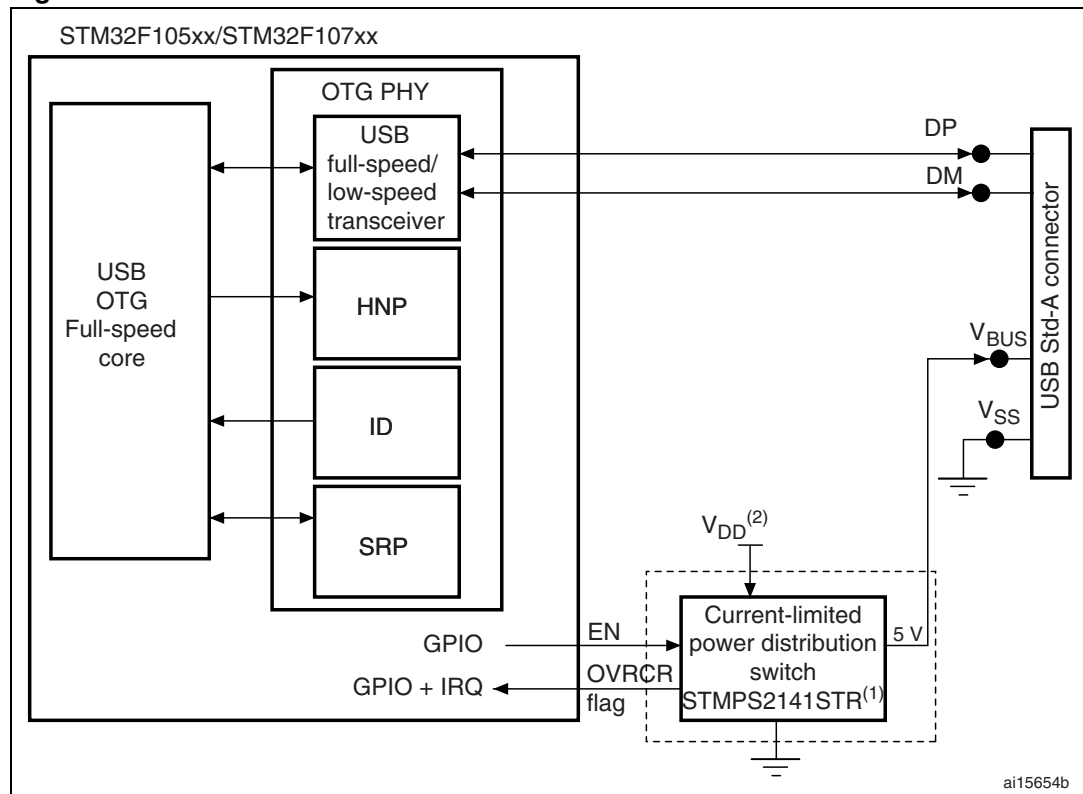

### A.1 USB OTG FS interface solutions

Figure 46. USB OTG FS device mode

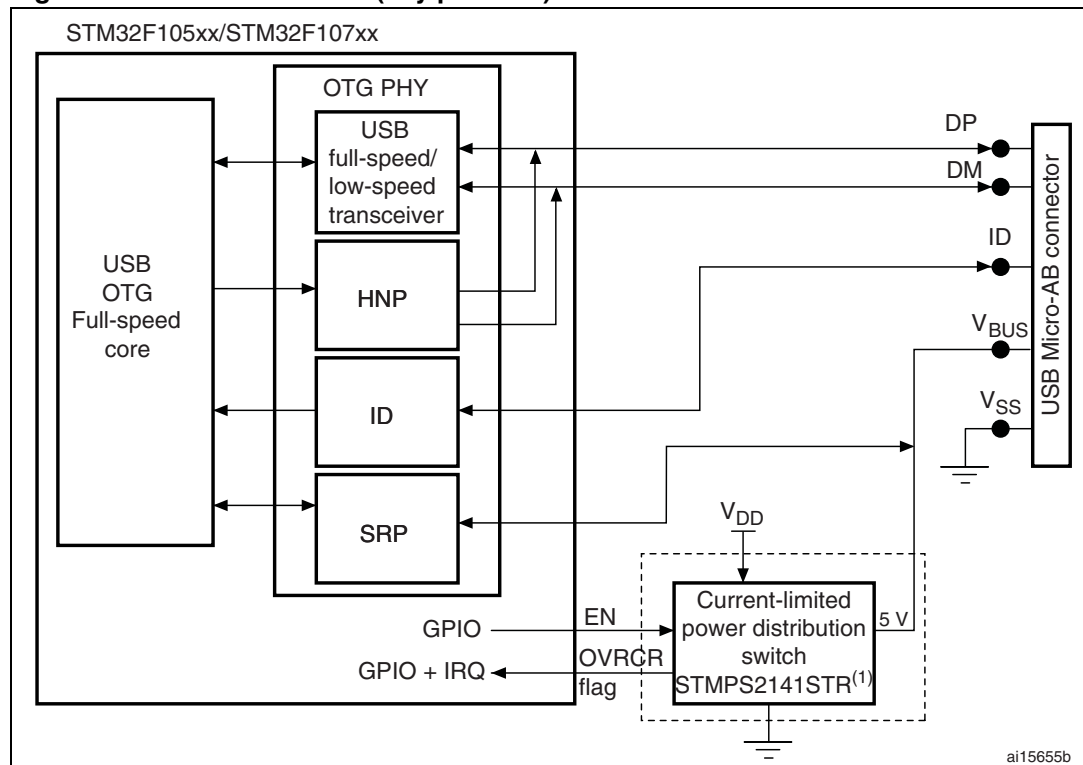

1. Use a regulator if you want to build a bus-powered device.

Figure 47. Host connection

1. STMP2141STR needed only if the application has to support bus-powered devices.

**Figure 48. OTG connection (any protocol)**

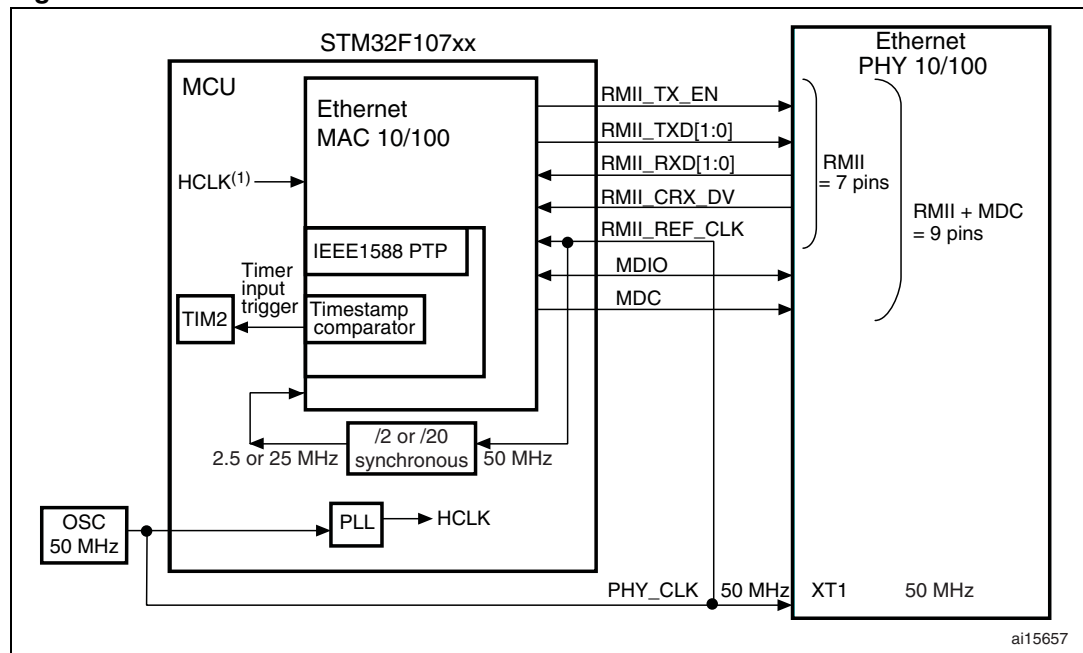

1. STMP2141STR needed only if the application has to support bus-powered devices.

## A.2 Ethernet interface solutions

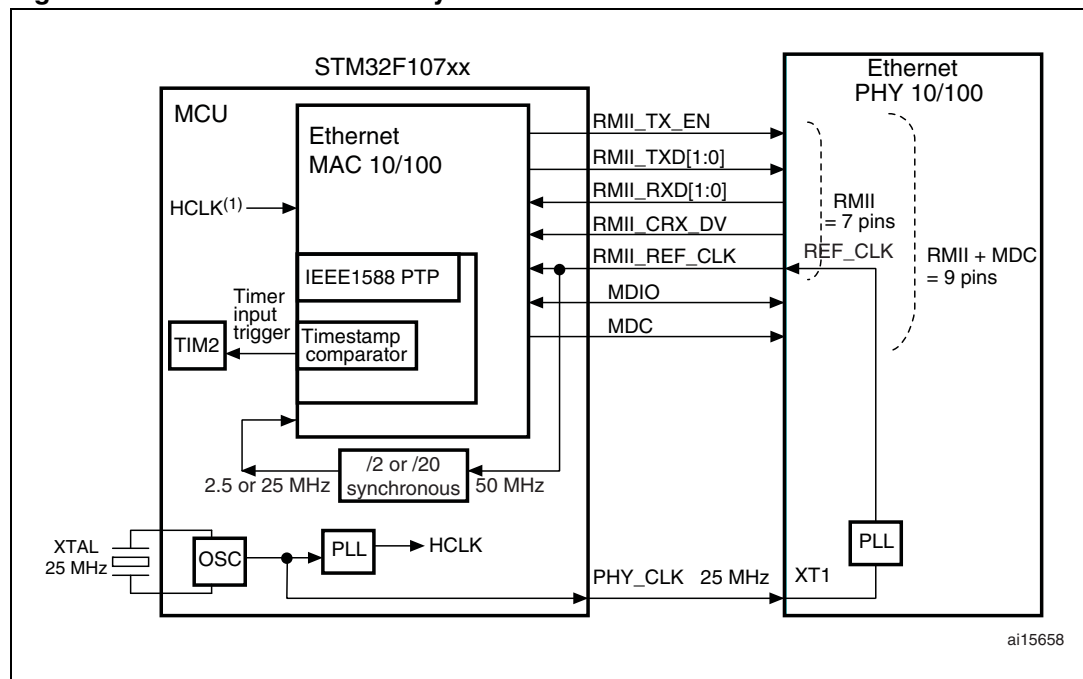

**Figure 49. MII mode using a 25 MHz crystal**

1. HCLK must be greater than 25 MHz.

2. Pulse per second when using IEEE1588 PTP, optional signal.

**Figure 50. RMI with a 50 MHz oscillator**

1. HCLK must be greater than 25 MHz.

**Figure 51. RMI with a 25 MHz crystal and PHY with PLL**

1. HCLK must be greater than 25 MHz.

**Figure 52. RMII with a 25 MHz crystal**

1. The NS DP83848 is recommended as the input jitter requirement of this PHY. It is compliant with the output jitter specification of the MCU.

### A.3 Complete audio player solutions

Two solutions are offered, illustrated in *Figure 53* and *Figure 54*.

Figure 53 shows storage media to audio DAC/amplifier streaming using a software Codec. This solution implements an audio crystal to provide audio class 1<sup>2</sup>S accuracy on the master clock (0.5% error maximum, see the Serial peripheral interface section in the reference manual for details).

**Figure 53. Complete audio player solution 1**

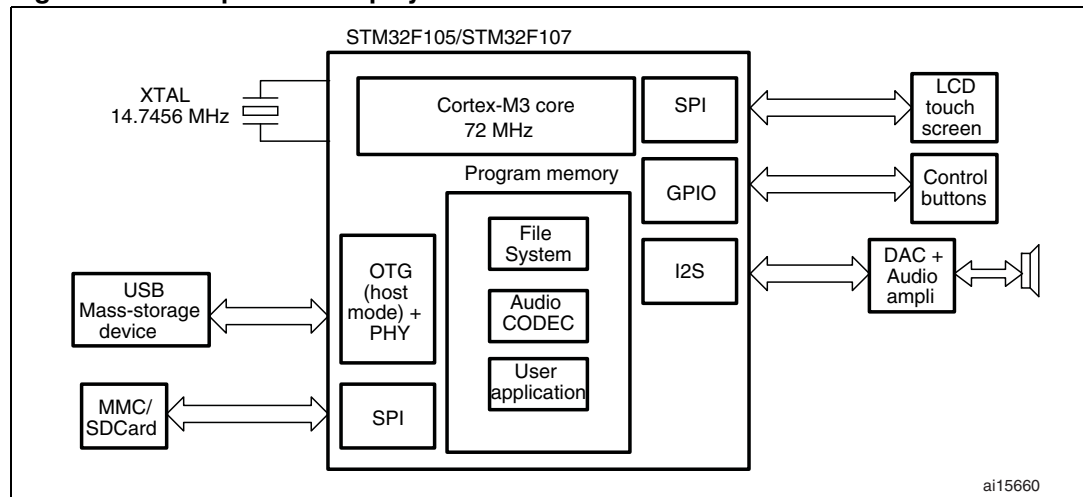

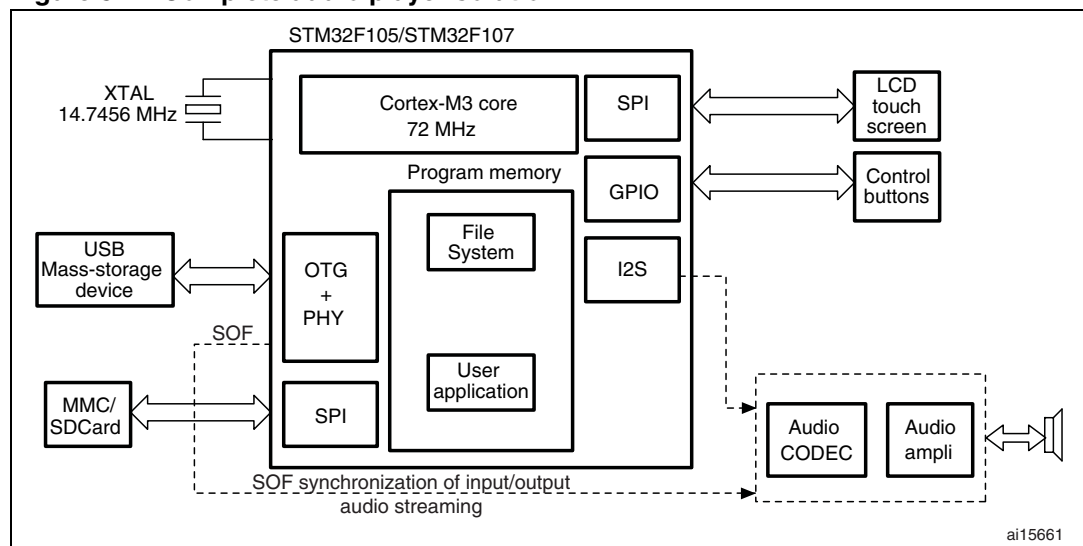

Figure 54 shows storage media to audio Codec/amplifier streaming with SOF synchronization of input/output audio streaming using a hardware Codec.

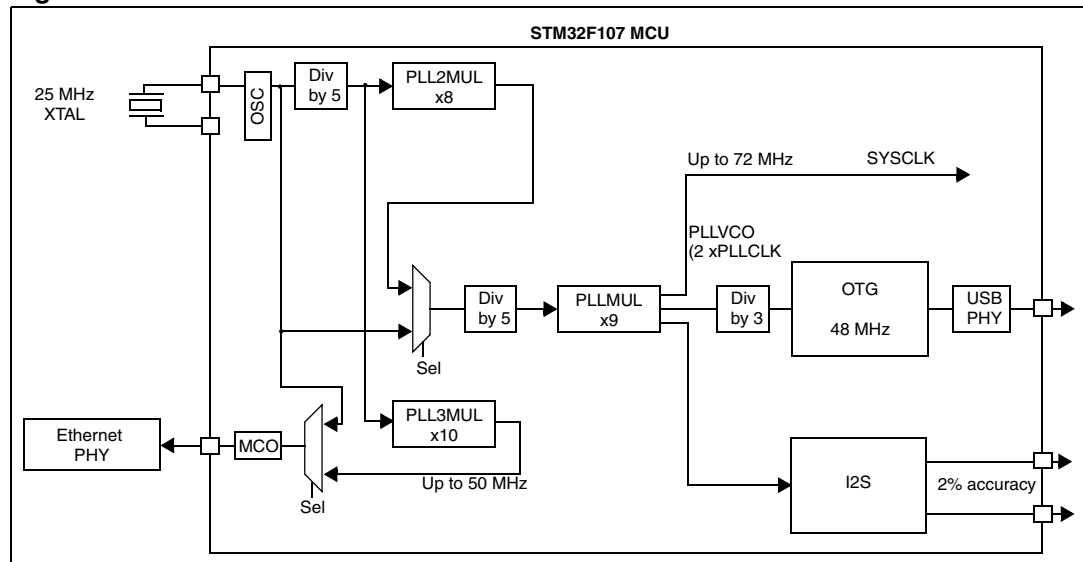

**Figure 54. Complete audio player solution 2**

## A.4 USB OTG FS interface + Ethernet/I<sup>2</sup>S interface solutions

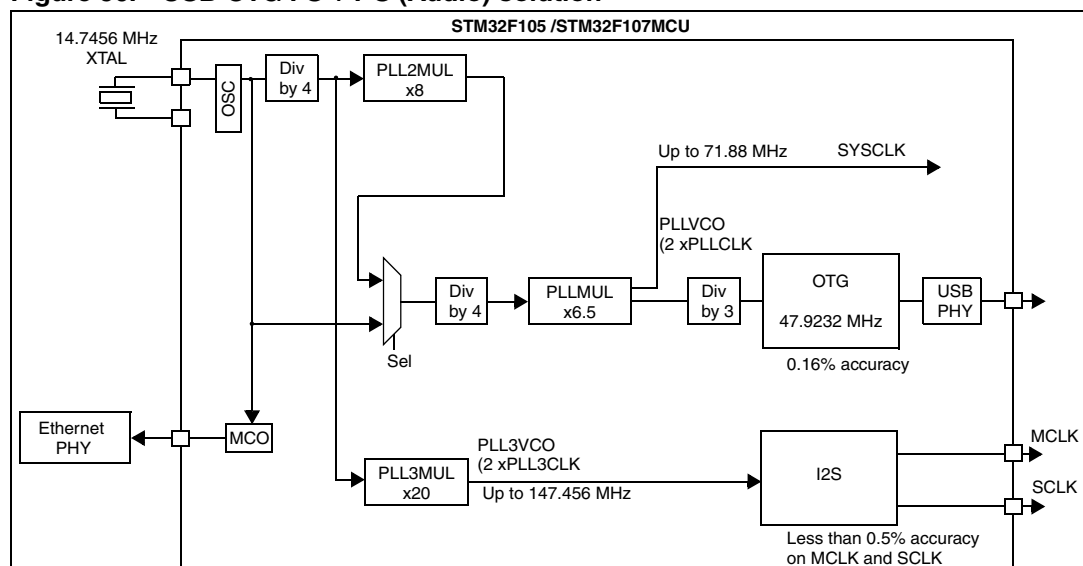

With the clock tree implemented on the STM32F107xx, only one crystal is required to work with both the USB (host/device/OTG) and the Ethernet (MII/RMII) interfaces. [Figure 55](#) illustrate the solution.

**Figure 55. USB OTG FS + Ethernet solution**

With the clock tree implemented on the STM32F107xx, only one crystal is required to work with both the USB (host/device/OTG) and the I<sup>2</sup>S (Audio) interfaces. [Figure 56](#) illustrate the solution.

**Figure 56. USB OTG FS + I<sup>2</sup>S (Audio) solution**

**Table 63. PLL configurations**

Application	Crystal value in MHz (XT1)	PREDIV2	PLL2MUL	PLLSRC	PREDIV1	PLLMUL	USB prescaler (PLL VCO output)	PLL3MUL	I2Sn clock input	MCO (main clock output)
Ethernet only	25	/5	PLL2ON x8	PLL2	/5	PLLON x9	NA	PLL3ON x10	NA	XT1 (MII) PLL3 (RMII)
Ethernet + OTG	25	/5	PLL2ON x8	PLL2	/5	PLLON x9	/3	PLL3ON x10	NA	XT1 (MII) PLL3 (RMII)
Ethernet + OTG + basic audio	25	/5	PLL2ON x8	PLL2	/5	PLLON x9	/3	PLL3ON x10	PLL	XT1 (MII) PLL3 (RMII)
Ethernet + OTG + Audio class I <sup>2</sup> S <sup>(1)</sup>	14.7456	/4	PLL2ON x12	PLL2	/4	PLLON x6.5	/3	PLL3ON x20	PLL3 VCO Out	NA ETH PHY must use its own crystal
OTG only	8	NA	PLL2OFF	XT1	/1	PLLON x9	/3	PLL3OFF	NA	NA
OTG + basic audio	8	NA	PLL2OFF	XT1	/1	PLLON x9	/3	PLL3OFF	PLL	NA
OTG + Audio class I <sup>2</sup> S <sup>(1)</sup>	14.7456	/4	PLL2ON x12	PLL2	/4	PLLON x6.5	/3	PLL3ON x20	PLL3 VCO Out	NA
Audio class I <sup>2</sup> S only <sup>(1)</sup>	14.7456	/4	PLL2ON x12	PLL2	/4	PLLON x6.5	NA	PLL3ON x20	PLL3 VCO out	NA

1. SYSCLK is set to be at 72 MHz except in this case where SYSCLK is at 71.88 MHz.

[Table 64](#) give the I<sub>DD</sub> run mode values that correspond to the conditions specified in [Table 63](#).

**Table 64. Applicative current consumption in Run mode, code with data processing running from Flash**

Symbol	parameter	Conditions <sup>(1)</sup>	Typ <sup>(2)</sup>	Max <sup>(2)</sup>		Unit
				85 °C	105 °C	
I <sub>DD</sub>	Supply current in run mode	External clock, all peripherals enabled except ethernet, HSE = 8 MHz, f <sub>HCLK</sub> = 72 MHz, no MCO	57	63	64	mA
		External clock, all peripherals enabled except ethernet, HSE = 14.74 MHz, f <sub>HCLK</sub> = 72 MHz, no MCO	60.5	67	68	
		External clock, all peripherals enabled except OTG, HSE = 25 MHz, f <sub>HCLK</sub> = 72 MHz, MCO = 25 MHz	53	60.7	61	
		External clock, all peripherals enabled, HSE = 25 MHz, f <sub>HCLK</sub> = 72 MHz, MCO = 25 MHz	60.5	65.5	66	
		External clock, all peripherals enabled, HSE = 25 MHz, f <sub>HCLK</sub> = 72 MHz, MCO = 50 MHz	64	69.7	70	
		External clock, all peripherals enabled, HSE = 50 MHz <sup>(3)</sup> , f <sub>HCLK</sub> = 72 MHz, no MCO	62.5	67.5	68	
		External clock, only OTG enabled, HSE = 8 MHz, f <sub>HCLK</sub> = 48 MHz, no MCO	26.7	None	None	
		External clock, only ethernet enabled, HSE = 25 MHz, f <sub>HCLK</sub> = 25 MHz, MCO = 25 MHz	14.3	None	None	

1. V<sub>DD</sub> = 3.3 V.

2. Based on characterization, not tested in production.

3. External oscillator.

## Revision history
